Cases for 120 mm and 80 mm DVD-RAM Disks
Cases for 120 mm and 80 mm DVD-RAM Disks
**Brief History**

ECMA Technical Committee TC31 was established in 1984 for the standardization of Optical Disks and Optical Disk Cartridges (ODC). Since its establishment, the Committee has made major contributions to ISO/IEC toward the development of International Standards for 80 mm, 90 mm, 120 mm, 130 mm, 300 mm, and 356 mm media. Numerous standards have been developed by TC31 and published by ECMA, almost all of which have also been adopted by ISO/IEC under the fast-track procedure. In February 1997 a group of ten Companies, known as the DVD Forum, proposed to TC31 to develop standards for the optical disks known as DVD disks. TC31 accepted this proposal and started the work that has led to two ECMA Standards that have been adopted by ISO/IEC under the fast-track procedure as International Standards.

- **ECMA-267 (1997)**  
  120 mm DVD-Read-Only Disk  
  *ISO/IEC 16448*

- **ECMA-268 (1997)**  
  80 mm DVD-Read-Only Disk  
  *ISO/IEC 16449*

Further work, supported by nine members of the DVD Forum, has been undertaken for a rewritable disk known as DVD-RAM has led to two further ECMA and ISO/IEC Standards

- **ECMA-272 (1998)**  
  120 mm DVD Rewritable Disk (DVD-RAM)  
  *ISO/IEC 16824*

- **ECMA-273 (1998)**  
  Case for 120 mm DVD-RAM Disks  
  *ISO/IEC 16825*

A new Standard ECMA-330 constituting a further development of Standard ECMA-272 proposed to, and accepted by, ECMA/TC31 on presentation by Toshiba Corporation on behalf of ten other Member Companies of the DVD Forum has been undertaken by ECMA/TC31. The development of the present Standard ECMA-331 was also proposed and accepted at the same time. It shall specify a case for use with the disks specified in Standard ECMA-330 so as to form an optical disk cartridge. Several Types are specified that allow meeting the requirements of different applications for which such cartridges are used. It is expected that a corresponding International Standard will be adopted by ISO/IEC.

This ECMA Standard specifies
– the environments in which the cases are to be operated and stored;
– the dimensional and mechanical characteristics of the case, so as to provide mechanical interchangeability between data processing systems;

This Standard ECMA-331 provides for mechanical interchange between optical disk drives. Together with Standard ECMA-330 for 120 mm (4.7 Gbytes per side) and 80 mm (1.46 Gbytes per side) DVD-RAM disks and a standard for volume and file structure, it provides for full data interchange between data processing systems.

2 Conformance

A claim of conformance with this ECMA Standard shall specify the Type implemented. A case shall be in conformance with this ECMA Standard if it meets the mandatory requirements specified herein for its Type.

4 Definitions

For the purpose of this ECMA Standard the following definitions apply:

4.1 Cartridge
A device consisting of a case containing a rewritable disk.
4.2 Case
The housing for an optical disk, that protects the disk and facilitates disk interchange.

5 Conventions and notations
5.1 Representation of numbers
A measured value is rounded off to the least significant digit of the corresponding specified value. For instance, it implies that a specified value of 1.26 with a positive tolerance of +0.01 and a negative tolerance of -0.02 allows a range of measured values from 1.235 to 1.275.

5.2 Names
The names of entities, e.g. specific sides, etc. are given a capital initial.

6 General description of the case
6.1 General description of the Type 1 case (Figure 1)
The case is a rigid protective container of rectangular shape. Sides A and B of the case are identical as far as the features given here are concerned. References to Sides A and B of the case can be changed to B or A, respectively. When the opening of the one is a head and spindle window for the spindle and the optical head of the drive, that of the other is an access window for the disk clamping apparatus. A shutter uncovers the windows upon insertion into the drive, and automatically covers them upon removal from the drive. The case has features that enable a drive to reject a mis-inserted cartridge, to inhibit writing, sensor holes, detents for autoloading and a vertical use, gripper slots for an autochanger, label areas and side identification marks.

Sides A and B of the case have the same configuration.

6.2 General description of the Type 2 case (Figure 2)
The Type 2 case has the same features as the Type 1 case, but with some differences. The shape of the case is different on Side A and on Side B. Side A does not need to have a location hole, an alignment hole, Reference Surfaces, a write-inhibit hole, sensor holes and sensing areas. The case has an opening closed by a cover. This cover can be opened. In open position, the disk can be taken out of the case. Sensor hole A1 is originally closed. If the disk has been removed from the case, then this hole remains permanently open, indicating that the original disk contained in the case has been removed at least once or has been replaced by another disk.

6.3 General description of the Type 3 case (Figure 2)
The Type 3 case is identical with Type 2 case except that the sensor hole A1 is always open.
Figure 1 - General view of the Type 1 case, seen from Side A
6.4 **General description of the Type 4 case (Figure 3)**

The Type 4 case has the same features as the Type 1 case, but with some differences. The case has an opening closed by a cover. This cover can be opened. In open position, the disk can be taken out of the case. If the disk has been removed from the case, then the sensor hole A1 and B1 remain permanently open, indicating that the original disk contained in the case has been removed at least once or has been replaced by another disk.

6.5 **General description of the Type 5 case (Figure 3)**

The Type 5 case is identical with Type 4 case except that the sensor hole A1 and B1 are always open.
6.6 **General description of the Type 6 case (Figure 4)**

The case is a rigid protective container of rectangular shape. It consists of a body and a disk holder. This disk holder can be taken out of the body and then the disk can be taken out of the case. Sensor hole A1 and B1 are originally closed. If the disk holder has been taken out of the body, then these holes remain permanently open, indicating that the original disk contained in the case has been removed at least once or has been replaced by another disk. Sides A and B of the case are identical as far as the features given here are concerned. References to Sides A and B of the case can be changed to B or A, respectively. When the opening of the one is a head and spindle window for the spindle and the optical head of the drive, that of the other is an access window for the disk clamping apparatus. A shutter uncovers the windows upon insertion into the drive, and automatically covers them upon removal from the drive. The case has features that enable a drive to reject a mis-inserted cartridge, to inhibit writing, sensor holes, detents for autoloading and a vertical use, gripper slots for an autochanger, label areas and side identification marks.

Sides A and B of the case have the same configuration.

6.7 **General description of the Type 7 case (Figure 5)**

The Type 7 case has the same features as the Type 6 case, but with some differences. The shape of the case is different on Side A and on Side B. Side A does not need to have a location hole, an alignment hole, Reference Surfaces, a write-inhibit hole, sensor holes and sensing areas. Sensor hole A1 is originally closed. If the disk holder has been taken out of the body, then this hole remains permanently open, indicating that the original disk contained in the case has been removed at least once or has been replaced by another disk. Side B of this case shall not have label area.
6.8 **General description of the Type 8 case (Figure 4)**
The Type 8 case is identical with Type 6 case except that the sensor hole A1 and B1 are always open.

6.9 **General description of the Type 9 case (Figure 5)**
The Type 9 case is identical with Type 7 case except that the sensor hole A1 is always open.

13.2 Mass
The mass of the case without the disk shall not exceed 40 g.

13.3 Edge distortion
The cartridge shall meet the requirement of the edge distortion test defined in annex E.

13.4 Compliance
The case shall meet the requirement of the compliance (flexibility) test defined in annex F.

13.5 Shutter opening force
The spring force on the shutter shall be such that the force required to open the shutter does not exceed 1,75 N while the vertical force F5 of 2,5 N is applied to the shutter top surface. (See annex G) It shall be sufficiently strong to close a free-sliding shutter, irrespective of the orientation of the case.

14 Interface between the case used as cartridge and a drive

14.1 Capture cylinder (Figure 50)
The capture cylinder is defined as the volume within which the spindle can expect the centre of the disk hole to be, just prior to capture, and with the cartridge constrained as specified in 13.4. The size of the cylinder defines the permissible play of the disk inside its cavity in the case. The cylinder is referred to perfectly located and perfectly sized alignment and location pins in the drive; it includes the tolerances of those dimensions of the case and the disk which are between the two pins mentioned and the centre of the disk.

The bottom of the cylinder shall be parallel to Reference Plane Z, and shall be located at a distance

\[ L_{501} = 1,1 \text{ mm min.} \]

above Reference Plane Z. The top of the cylinder is located at a distance

\[ L_{502} = 3,6 \text{ mm max.} \]

from Reference Plane Z. The diameter of the cylinder shall be

\[ D_{501} = 2,8 \text{ mm max.} \]

and its centre shall be given by the nominal values of \( L_{145} \) and \( L_{149} \) of Type 6 case or Type 8 case, or \( L_{347} \) and \( L_{351} \) of Type 7 case or Type 9 cases, in the drive.

14.2 Inner dimensions of the case (Figure 51)
The inner space of the disk shall be such that the disk is not in contact with the case during operation. The inner shape of the case shall meet the following requirements.

\[ L_{503} = 1,7 \text{ mm max.} \]

\[ L_{505} = 0,3 \text{ mm} \quad +0,1 \text{ mm} \]
\[ -0,0 \text{ mm} \]
\[ +0,1 \text{ mm} \]

\[ L_{506} = 0,3 \text{ mm} \quad +0,1 \text{ mm} \]
\[ -0,0 \text{ mm} \]

from the surfaces of \( L_{503} \) and \( L_{504} \) respectively and

\[ R_{501} = 15,5 \text{ mm max.} \]
\[ R_{502} = 40.7 \text{ mm min.} \]
from a centre given by the nominal values of \( L_{145} \) and \( L_{149} \) of Type 6 case or Type 8 case, or \( L_{347} \) and \( L_{351} \) of Type 7 or Type 9 cases.

15 Orientation of the disk in the case

15.1 Two-sided disk (Type 2S) in case Types 6 and 8

The disk surfaces are defined as Side A and Side B. Sides A and B of the case are identical as far as the features specified in this ECMA Standard are concerned. The two-sided disk (Type 2S) has no specific orientation in the case. Therefore, references to Sides A and B of the case can be changed to B and A respectively.

15.2 One-sided disk (Type 1S) in case Types 7 and 9

A one-sided disk (Type 1S) has only one functional entrance surface defined as Side A. The disk shall be oriented in the case so that when Side A of the case faces upwards, Side A of the disk faces downwards.

Transportation

K.1 General
As transportation occurs under a wide range of temperature and humidity variations, for differing periods, by many methods of transport and in all parts of the world it is not possible to specify conditions for transportation or for packaging.

K.2 Packaging
The form of packaging should be agreed between sender and recipient or, in the absence of such agreement, is the responsibility of the sender. It should take account of the following hazards.

K.2.1 Temperature and Humidity
Insulation and wrapping should be designed to maintain the conditions for storage over the estimated period of transportation.

K.2.2 Impact loads and vibration
a) Avoid mechanical loads that would distort the shape of the case or cartridge.

b) Avoid dropping the case or cartridge.

c) Cases or cartridges should be packed in a rigid box containing adequate shock-absorbent material.

d) The final box should have a clean interior and a construction that provides sealing to prevent the ingress of dirt and moisture.
