Private Telecommunication Networks (PTN) - Specification, Functional Models and Information Flows - Name Identification Supplementary Services
Private Telecommunication Networks (PTN) - Specification, Functional Models and Information Flows - Name Identification Supplementary Services (NISD)
Brief history

This Standard is one of a series of ECMA standards defining services and signalling protocols applicable to Private Telecommunication Networks (PTNs). The series uses the ISDN concepts as developed by the ITU-T and is also within the framework of standards for open systems interconnection as defined by ISO. It has been produced under ETSI IMCC work item DE/ECMA-00005.

This particular Standard specifies the Calling Name Identification Presentation, the Connected Name Identification Presentation and the Calling/Connected Name Identification Restriction supplementary services.

This Standard is based upon the practical experience of ECMA member companies and the results of their active and continuous participation in the work of ISO/IEC JTC1, ITU-T, ETSI and other international and national standardization bodies. It represents a pragmatic and widely based consensus.

Compared to the 1st Edition of Standard ECMA-163 (published by ECMA in March 1992), various changes have been made in order to achieve alignment with ETS 300 237 (which is based on the 1st Edition of ECMA-163 but modified during Public Enquiry and published by ETSI in June 1993).

### Annex A (normative) Structure and content of a PTN name

- iii -
1 Scope
This Standard specifies the supplementary services Calling Name Identification Presentation (SS-CNIP), Connected Name Identification Presentation (SS-CONP) and Calling/Connected Name Identification Restriction (SS-CNIR), which are applicable to various basic services supported by Private Telecommunication Networks (PTNs). Basic services are specified in ETS 300 171.

Calling Name Identification Presentation (SS-CNIP) is a supplementary service which is offered to the called user and which provides the name of the calling user (calling party name) to the called user.

Connected Name Identification Presentation (SS-CONP) is a supplementary service which is offered to the calling user and which provides to the calling user the following:
- the name of the user who answers the call (connected party name),
- optionally the name of the alerting user (called party name),
- optionally the name of the called user who cannot be reached (busy party name).

Calling/Connected Name Identification Restriction (SS-CNIR) is a supplementary service which is offered to a user to restrict presentation of that user's name to another user.

Provision of a user's name to the PTN is outside the scope of this Standard.

Service specifications are produced in three stages, according to the method described in ENV 41005.

This Standard contains the stage 1 and 2 specifications of the Name Identification supplementary services. The stage 1 specifications specify the supplementary services as seen by users of PTNs. The stage 2 specifications identify the functional entities involved in the supplementary services and the information flows between them.

2 Conformance
In order to conform to this Standard, a stage 3 standard shall specify signalling protocols and equipment behaviour that are capable of being used in a PTN which supports the supplementary service(s) specified in this Standard. This means that, to claim conformance, a stage 3 standard is required to be adequate for the support of those aspects of the stage 1 and stage 2 clauses for that supplementary service which are relevant to the interface or equipment to which the stage 3 standard applies.

These stage 1 and stage 2 clauses for the Calling Name Identification Presentation supplementary service are clauses 6 and 9 respectively.

These stage 1 and stage 2 clauses for the Connected Name Identification Presentation supplementary service are clauses 7 and 10 respectively.

These stage 1 and stage 2 clauses for the Calling/Connected Name Identification Restriction supplementary service are clauses 8 and 11 respectively.

4 Definitions
For the purpose of this Standard the following definitions apply.

4.1 External definitions
This Standard uses the following terms defined in other documents:
- Basic Service (CCITT Rec. I.210)
- Connection (CCITT Rec. I.112)
- Integrated Services Digital Networks (CCITT Rec. I.112)
- Private (ENV 41007)
- Private Telecommunication Network Exchange (ENV 41007)
- Public (ENV 41007)
- Public ISDN (ENV 41007)
- Service (CCITT Rec. I.112)
- Signalling (CCITT Rec. I.112)
- Supplementary Service (CCITT Rec. I.210)
- Telecommunication Network (ENV 41007)
- Terminal, Terminal equipment (ENV 41007)
- User (ETS 300 171)

This Standard refers to the following basic call functional entities defined in ETS 300 171:
- Call Control
- Call Control Agent

This Standard refers to the following basic call inter-FE relationships defined in ETS 300 171:
- r1
- r2

This Standard refers to the following basic call information flows defined in ETS 300 171:
- DISCONNECT request/indication
- REPORT request/indication
- RELEASE request/indication
- SETUP request/indication
- SETUP response/confirmation
- SETUP REJECT request/indication

4.2 Additional Network Feature
A capability, over and above that of a basic service, provided by a PTN, but not directly to a PTN user.

4.3 Application identifier
Manufacturer-specific information that can accompany a name and imply the structure of the name (see annex A).

4.4 Busy
An ISDN destination is considered to be busy if either a "network determined user busy" or a "user determined user busy" conditions occurs.

4.5 Busy party name
The name of the called user who cannot be reached because of a busy condition.

4.6 Call, basic call
An instance of the use of a basic service.
4.7 Calling party name
The name of the calling user.

4.8 Connected party name
The name of the user who answers the call.

4.9 Called party name
The name of the alerting user.

4.10 Name
A string of maximum 50 characters which is used for the name identification of the PTN user of a call.

NOTE 1
The structure and content of a name are defined in annex A.

6 SS-CNIP Stage 1 description
6.1 Description
6.1.1 General description
Calling Name Identification Presentation (SS-CNIP) is a supplementary service which is offered to the called user and which provides the name of the calling user (calling party name) to the called user.

The PTN provides the calling party name to the called user when an incoming call is presented.

The possible provision of the calling party name by the calling user to the PTN is outside the scope of this Standard.

6.1.2 Qualifications on applicability to telecommunication services
This supplementary service is applicable to all basic telecommunication services.

6.2 Procedures
6.2.1 Provision/withdrawal
SS-CNIP shall be generally available. There is no need for service profile control.

Some users may have a service profile which permits the override of calling name identification restriction.

6.2.2 Normal procedures
6.2.2.1 Activation/Deactivation/Registration/Interrogation
SS-CNIP shall be permanently activated. No information needs to be registered with the PTN for this supplementary service, and therefore interrogation is not applicable.

6.2.2.2 Invocation and operation
The PTN shall provide the called user with the calling party name at the same time as indicating an incoming call.
The method by which the PTN obtains the name information is implementation-dependent and outside the scope of this Standard. The management of the PTN name directory system is also outside the scope of this Standard.

6.2.3 Exceptional procedures

6.2.3.1 Invocation and operation

There are two exceptions when the calling party name shall not be presented to the called user:

- when the calling name identification restriction has been invoked (see definition of the Calling/Connected Name Identification Restriction), and
- when the calling party name is not available, e.g. due to interworking with another network or when no name is registered against the calling PTN user.

In such cases the called user shall receive an indication of the situation.

In some cases where calling name identification restriction has been invoked, there may be certain categories of called user that have the service profile to override this restriction and have the calling party name presented, e.g. emergency stations, PTN operators. In these circumstances, presentation shall include an indication that restriction has been invoked.

6.3 Interactions with other supplementary services

This clause specifies interactions with other supplementary services for which PTN standards were available at the time of publication of this Standard.

6.3.1 Connected Name Identification Presentation (CONP)

No interactions.

6.3.2 Calling/Connected Name Identification Restriction (CNIR)

The calling party name shall not be presented if calling name identification restriction has been invoked at the calling user, unless the called user has the service profile to override this restriction.

6.3.3 Calling Line Identification Presentation (CLIP)

No interactions.

6.3.4 Connected Line Identification Presentation (COLP)

No interactions.

6.3.5 Calling/Connected Line Identification Restriction (CLIR)

No interactions.

6.4 Interworking considerations

6.4.1 Incoming calls

On calls incoming from another network, the calling party name shall be obtained from the other network if available. Where no name is provided by the other network, the called PTN user shall be given an indication "name unavailable" or "presentation restricted", as appropriate.

6.4.2 Outgoing calls

On outgoing calls to another network, the PTN shall provide the calling party name to the other network if this network supports an equivalent supplementary service and if the name is available and presentation not restricted.

6.5 Overall SDL

Figure 1 contains the dynamic description of SS-CNIP using the SDL defined in CCITT Rec. Z.100. The SDL process represents the behaviour of the network in providing SS-CNIP. The relationship to the basic call process is indicated in the annotations.

Output signals to the right represent primitives to the called PTN user. Input signals from the left represent internal stimuli.
CNIP is invoked at the same time as the basic call SETUP_indication is sent to the called user.

Figure 1 - SS-CNIP overall SDL.
7 SS-CONP Stage 1 description

7.1 Description

7.1.1 General description

Connected Name Identification Presentation (SS-CONP) is a supplementary service which is offered to the calling user and which provides to the calling user the following:

− the name of the user who answers the call (connected party name),
− optionally the name of the alerting user (called party name),
− optionally the name of the called user who cannot be reached (busy party name).

The PTN provides the connected party name to the calling user when the called user connects to the incoming call. The PTN optionally provides the busy party name to the calling user when the called user is busy. The PTN optionally provides the called party name to the calling user when the called user is alerting.

NOTE 2

Interactions with certain supplementary services may cause the connected party name to differ from the called party name.

The possible provision of the connected party name by the connected user to the PTN is outside the scope of this Standard.

7.1.2 Qualifications on applicability to telecommunication services

This supplementary service is applicable to all basic telecommunication services.

7.2 Procedures

7.2.1 Provision/withdrawal

SS-CONP shall be generally available. There is no need for service profile control.

Some users may have a service profile which permits the override of connected/called/busy name identification restriction.

7.2.2 Normal procedures

7.2.2.1 Activation/Deactivation/Registration/Interrogation

SS-CONP shall be permanently activated. No information needs to be registered with the PTN for this supplementary service, and therefore interrogation is not applicable.

7.2.2.2 Invocation and operation

The PTN shall provide the calling user with the connected party name at the same time as indicating that call establishment is complete. The PTN may provide the calling user with the busy party name at the same time as indicating that call establishment is unsuccessful. The PTN may provide the calling user with the called party name at the same time as indicating that the call is alerting.

The method by which the PTN obtains the name information is implementation-dependent and outside the scope of this Standard. The management of the PTN name directory system is also outside the scope of this Standard.

7.2.3 Exceptional procedures

7.2.3.1 Invocation and operation

There are two exceptions when the connected/called/busy party name shall not be presented to the calling user:

− when the connected/called/busy name identification restriction has been invoked (see definition of Calling/Connected Name Identification Restriction), and
− when the connected/called/busy party name is not available, e.g. due to interworking with another network or when no name is registered against the destination PTN user.

In such cases the calling user shall receive an indication of the situation.
In some cases where Connected Name Identification Restriction has been invoked, there may be certain categories of calling user that have the service profile to override this restriction and have the connected/called/busy party name presented, e.g. emergency stations, PTN operators. In these circumstances, presentation shall include an indication that restriction has been invoked.

7.3 Interactions with other supplementary services
This clause specifies interactions with other supplementary services for which PTN standards were available at the time of publication of this Standard.

7.3.1 Calling Name Identification Presentation (CNIP)
No interactions.

7.3.2 Calling/Connected Name Identification Restriction (CNIR)
The connected/called/busy party name shall not be presented if Connected Name Identification Restriction has been invoked at the destination user, unless the calling user has the service profile to override this restriction.

7.3.3 Calling Line Identification Presentation (CLIP)
No interactions.

7.3.4 Connected Line Identification Presentation (COLP)
No interactions.

7.3.5 Calling/Connected Line Identification Restriction (CLIR)
No interactions.

7.4 Interworking considerations

7.4.1 Outgoing calls
On calls outgoing to another network, the connected/called/busy party name shall be obtained from the other network if available. Where no name is provided by the other network, the calling PTN user shall be given an indication “name unavailable” or “presentation restricted”, as appropriate.

7.4.2 Incoming calls
On incoming calls from another network, the PTN shall provide the connected/called/busy party name to the other network if this network supports an equivalent supplementary service and if the name is available and presentation not restricted.

7.5 Overall SDL
Figure 2 contains the dynamic description of SS-CONP using the SDL defined in CCITT Rec. Z.100. The SDL process represents the behaviour of the network in providing SS-CONP. The relationship to the basic call process is indicated in the annotations.

Output signals to the left represent primitives to the calling PTN user. Input signals from the right represent internal stimuli.
CONP is invoked at the same time as the basic call setup_confirmation, report_indication or release_indication is sent to the calling user.

Figure 2 - SS-CONP overall SDL.
8 SS-CNIR Stage 1 description

8.1 Description

8.1.1 General description

Calling/Connected Name Identification Restriction (SS-CNIR) is a supplementary service which is offered to a user to restrict presentation of that user's name to another user.

When SS-CNIR applies to a user, the user's name is normally not presented to any other user.

8.1.2 Qualifications on applicability to telecommunication services

The supplementary service is applicable to all basic telecommunication services.

8.2 Procedures

8.2.1 Provision/withdrawal

SS-CNIR shall be provided on a service profile basis. A PTN may provide one or more of several service options. The options shall apply separately to each name. The following service profile options are available.

- SS-CNIR mode:
  - permanent (invoked for all calls)
  - temporary (specified by user per call)

- Default for temporary mode:
  - presentation restricted
  - presentation not restricted

8.2.2 Normal procedures

8.2.2.1 Activation/Deactivation/Registration/Interrogation

SS-CNIR shall be activated on provision and deactivated on withdrawal. This supplementary service requires no registration and admits no interrogation.

8.2.2.2 Invocation and operation

If permanent mode is provided, identification restriction shall be invoked automatically for all calls originating or terminating at the PTN user concerned.

If temporary mode is provided, the called party name and busy name shall not be presented. If temporary mode with default "presentation restricted" is provided, identification restriction of the calling party name and connected party name shall be invoked automatically for all calls originating or terminating at the PTN user concerned, unless requested otherwise by the PTN user at call establishment time. If temporary mode with default "presentation not restricted" is provided, identification restriction of the calling party name and connected party name shall not be invoked automatically for calls originating or terminating at the PTN user concerned, unless requested otherwise by the PTN user at call establishment time.

To override the default for an outgoing call when temporary mode is provided, the calling user makes a request for restriction or no restriction at the same time as requesting call establishment. To override the default for an incoming call when temporary mode is provided, the called user makes a request for restriction or no restriction at the same time as responding to the incoming call indication.

If identification restriction is invoked for an outgoing call, the calling party name shall be marked by the PTN as "presentation restricted". This prevents presentation to the called user (unless the called user has an override service profile).

If identification restriction is invoked for an incoming call, the connected/called/busy party name shall be marked by the PTN as "presentation restricted". This prevents presentation to the calling user (unless the calling user has an override service profile).

8.2.3 Exceptional procedures

8.2.3.1 Invocation and operation

A request from the PTN user for the override of a default shall be ignored if the PTN user is not provided with the temporary mode.
8.3 **Interactions with other supplementary services**

This clause specifies interactions with other supplementary services for which PTN standards were available at the time of publication of this Standard.

**8.3.1 Calling Name Identification Presentation (CNIP)**

See SS-CNIP clause 6.3.2.

**8.3.2 Connected Name Identification Presentation (CONP)**

See SS-CONP clause 7.3.2.

**8.3.3 Calling Line Identification Presentation (CLIP)**

No interactions.

**8.3.4 Connected Line Identification Presentation (COLP)**

No interactions.

**8.3.5 Calling/Connected Line Identification Restriction (CLIR)**

No interactions.

8.4 **Interworking considerations**

**8.4.1 Incoming calls**

This PTN supplementary service does not apply to the calling user of an incoming call. The other network may provide the equivalent service, in which case the PTN may receive an indication that presentation of the calling party name is restricted. In such a situation the other network may or may not supply the calling party name to the PTN. If not provided, even a called PTN user with an override service profile will be given only an indication that presentation is restricted. If the called user has invoked name identification restriction, the connected/called/busy party name is marked as "presentation restricted". This indication shall be passed on to the other network.

**8.4.2 Outgoing calls**

This PTN supplementary service does not apply to the connected user of an outgoing call. The other network may provide the equivalent service, in which case the PTN may receive an indication that presentation of the connected/called/busy party name is restricted. In such a situation the other network may or may not supply the connected/called/busy party name to the PTN. If not provided, even a calling PTN user with an override service profile will be given only an indication that presentation is restricted. If the calling user has invoked name identification restriction, the calling party name shall be marked as "presentation restricted". This indication shall be passed on to the other network.

8.5 **Overall SDL**

Figure 3 contains the dynamic description of SS-CNIR using the SDL defined in CCITT Rec. Z.100. The SDL process represents the behaviour of the network in providing SS-CNIR. The relationship to the basic call process is indicated in the annotations.

Input signals from the left represent primitives from the served PTN user. Input signals from the right represent internal stimuli.
Figure 3 - SS-CNIR overall SDL
9 SS-CNIP Stage 2 description

9.1 Functional model

9.1.1 Functional model description

The functional model for SS-CNIP shall comprise the FEs "CNIP Provision" (FE1), "CNIP Presentation" (FE2) and "CNIP Reception" (FE3). A relationship ra shall exist between FE1 and FE2 and relationship rb shall exist between FE2 and FE3. Figure 4 shows these FEs and relationships.

![Diagram of functional model and relationship to basic call for SS-CNIP](image)

**Figure 4 - Functional model and relationship to basic call for SS-CNIP**

9.1.2 Description of functional entities

The functional entities required by SS-CNIP shall be as follows:

- FE1 CNIP Provision: responsible for provision of the calling party name information and associated indicators to FE2.
- FE2 CNIP Presentation: responsible for reporting the calling party name information and associated indicators to FE3.
- FE3 CNIP Reception: responsible for delivery of the calling party name information and associated indicators to the PTN user.

*NOTE 3*  
The structure of the name information is described in annex A of this Standard.

*NOTE 4*  
The possibility that the name information is stored in another FE (data base) and provided to FE1 on request for delivery to FE2 is outside the scope of this Standard.

9.1.3 Relationship of functional model to basic call functional model

Figure 4 also shows the relationship with a basic service for SS-CNIP.

9.2 Information flows

9.2.1 Definition of information flows

The information flows INFORM 1 and INFORM 2 shall apply for SS-CNIP.

In the tables below, the column headed "Request" indicates which of the service elements are mandatory (M) and which are optional (O) in a request/indication information flow. The column headed "Confirm" indicates which of the service elements are mandatory (M) and which are optional (O) in a response/confirmation information flow.

9.2.1.1 INFORM 1

This unconfirmed information flow, which conveys the calling party name, shall be sent over relationship ra (optional in the case of name unavailable, otherwise mandatory). It shall contain the service elements listed in table 1.
Table 1 - Content of INFORM 1

**NOTE 6**

The service element shall be present as indicated if the name is available and not restricted, or if restricted and the called user has an override service profile. Otherwise the service element shall be omitted.

9.2.2 Relationship of information flows to basic call information flows

The SS-CNIP information flow shall be sent at the same time as the basic call information flow SETUP request/indication (r2/r3 in figure 5).

9.2.3 Information flow sequences

Signalling procedures shall be provided in support of the information flow sequences specified below. In addition, signalling procedures shall be provided to cover other sequences arising from error situations, interactions with basic call, interactions with other supplementary services, different topologies, etc..

In figure 5, SS-CNIP information flows are represented by solid arrows and basic call information flows are represented by broken arrows. An ellipse embracing two information flows indicates that the two information flows occur together. Within a column representing an SS-CNIP functional entity, the numbers refer to functional entity actions listed in 9.3.

Figure 5 shows the information flow sequence for normal operation of SS-CNIP.
9.3 Functional entity actions

The following FE actions shall occur at the points indicated in figure 5:

− FE1 action 101:
  Generate INFORM 1 request/indication (if available) and send it at the same time as the basic call SETUP request/indication to the subsequent functional entity FE2.

− FE2 action 201:
  Receive INFORM 1 request/indication, remove the name information according to element Presentation Indicator and the override service profile of the called user and send INFORM 2 at the same time as the basic call SETUP request/indication to the functional entity FE3.

− FE3 action 301:
  Receive INFORM 2 request/indication and provide the received information to the called PTN user.

9.4 Functional entity behaviour

Figures 6, 7 and 8 are intended to illustrate typical FE behaviour in terms of information flows sent and received. The figures show the behaviour of the functional entities FE1, FE2 and FE3 in providing SS-CNIP using the SDL defined in CCITT Rec. Z.100.

Output signals to the right represent information flows to other functional entities or primitives to the called PTN user. Input signals from the left represent information flows from other functional entities or internal stimuli. The relationship to the basic call process is indicated in the annotations.

10 SS-CONP Stage 2 description

10.1 Functional model

10.1.1 Functional model description

The functional model for SS-CONP shall comprise the FEs "CONP Provision" (FE4), "CONP Presentation" (FE5) and "CONP Reception" (FE6). A relationship rc shall exist between FE4 and FE5 and a relationship rd shall exist between FE5 and FE6. Figure 9 shows these FEs and relationships.
10.1.2 Description of functional entities

The functional entities required by SS-CONP shall be as follows:

- **FE4** CONP Provision: responsible for provision of the connected/called/busy party name information and associated indicators to FE5.

- **FE5** CONP Presentation: responsible for reporting the connected/called/busy party name information and associated indicators to FE6.

- **FE6** CONP Reception: responsible for delivery of the connected/called/busy party name information and associated indicators to the PTN user.

**NOTE 7**
The structure of the name information is described in annex A of this Standard.

**NOTE 8**
The possibility that the name information is stored in another FE (data base) and provided to FE4 on request for delivery to FE5 is outside the scope of this Standard.

**NOTE 9**
Interactions with certain supplementary services may cause the connected/busy party name to differ from the called party name.

10.1.3 Relationship of functional model to basic call functional model

Figure 9 shows also the relationship with a basic service for SS-CONP.

10.2 Information flows

10.2.1 Definition of information flows

The information flows INFORM 3, INFORM 4, INFORM 5, INFORM 6, INFORM 7 and INFORM 8 shall apply for SS-CONP.

In the tables below, the column headed "Request" indicates which of the service elements are mandatory (M) and which are optional (O) in a request/indication flow. The column headed "Confirm" indicates which of the service elements are mandatory (M) and which are optional (O) in a response/confirmation information flow.

10.2.1.1 INFORM 3

This unconfirmed information flow, which conveys the connected party name, shall be sent over relationship rc (optional in the case of name unavailable, otherwise mandatory). It shall contain the service elements listed in table 4.
Table 4 - Content of INFORM 3

<table>
<thead>
<tr>
<th>Service elements</th>

<td></td>
</tr>
</tbody>
</table>

**NOTE 15**

The service element shall be present as indicated if the name is available and not restricted, or if restricted and the calling user has an override service profile. Otherwise the service element shall be omitted.

10.2.2 Relationship of information flows to basic call information flows

The SS-CONP information flows INFORM 3 request/indication and INFORM 4 request/indication shall be sent at the same time as the basic call information flow SETUP response/confirmation (r2/r1) for the connected party name. The SS-CONP information flows INFORM 5 request/indication and INFORM 6 request/indication shall be sent at the same time as the basic call information flow REPORT request/indication (r2/r1) for the called party name. The SS-CONP information flows INFORM 7 request/indication and INFORM 8 request/indication shall be sent at the same time as the basic call information flow RELEASE request/indication (r2) and DISCONNECT request/indication (r1) for the busy party name.

10.2.3 Information flow sequences

Signalling procedures shall be provided in support of the information flow sequences specified below. In addition, signalling procedures shall be provided to cover other sequences arising from error situations, interactions with basic call, interactions with other supplementary services, different topologies, etc..

In figures 10 and 11 below, SS-CONP information flows are represented by solid arrows and basic call information flows are represented by broken arrows. An ellipse embracing two information flows indicates that the information flows occur together. Within a column representing an SS-CONP functional entity, the numbers refer to functional entity actions listed in 10.3.

Figures 10 and 11 show the information flow sequences for normal operation of SS-CONP.

10.3 Functional entity actions

The following FE actions shall occur at the points indicated in figures 10 and 11:

- **FE4 action 401:**
  
  Generate INFORM 3 request/indication (if available) and send it at the same time as the basic call SETUP response/confirmation to the subsequent functional entity FE5. Generate optionally INFORM 5 request/indication (if available) and send it at the same time as the basic call REPORT request/indication to the subsequent functional entity FE5. Generate optionally INFORM 7 request/indication (if available) and send it at the same time as the basic call RELEASE request/indication to the subsequent functional entity FE5.

- **FE5 action 501:**
  
  Receive INFORM 3 request/indication, remove the name according to element Presentation Indicator and the override service profile of the calling user and send this information in INFORM 4 request/indication at the same time as the basic call SETUP response/confirmation to the functional entity FE6. Receive optionally INFORM 5 request/indication, remove the name according to element Presentation Indicator and the override service profile of the calling user and send this information in INFORM 6 request/indication at the same time as the basic call REPORT request/indication to the functional entity FE6. Receive optionally INFORM 7 request/indication, remove the name according to element Presentation Indicator and the override service profile of the calling user and send this information in INFORM 8 request/indication at the same time as the basic call DISCONNECT request/indication to the functional entity FE6.
- **FE6 action 601:**

Receive INFORM 4 request/indication, receive optionally INFORM 6 request/indication and INFORM 8 request/indication and provide the received information to the calling PTN user.

---

**Figure 10 - Information flow sequence for SS-CONP when the called user is free**

**Figure 11 - Information flow sequence for SS-CONP when the called user is busy**
10.4 Functional entity behaviour

Figures 12, 13, and 14 are intended to illustrate typical FE behaviour in terms of information flows sent and received. The figures show the behaviour of the functional entities FE4, FE5 and FE6 in providing SS-CONP using the SDL defined in CCITT Rec. Z.100.

Output signals to the left represent information flows to other functional entities or primitives to the calling PTN user. Input signals from the right represent information flows from other functional entities or internal stimuli. The relationship to the basic call process is indicated in the annotations.
Figure 12 - SDL for functional entity FE4
Figure 13 - SDL for functional entity FE5
10.5 Allocation of functional entities to physical locations

The allocation of FEs to physical equipment for SS-CONP as shown in table 10 shall apply. If the served user's TE is the stimulus with respect to SS-CONP, FE6 shall be located in the Originating PTNX.

Table 10 - Allocation of functional entities to physical location for SS-CONP

</table>

11 SS-CNIR Stage 2 description

11.1 Functional model

11.1.1 Functional model description

The functional model for SS-CNIR shall comprise the FEs "Restriction Request" (FE7) and "Restriction Control" (FE8). A relationship shall exist between FE7 and FE8. Figure 15 shows these FEs and relationships.
11.1.2 Description of functional entities
The functional entities required by SS-CNIR shall be as follows:

- **FE7** Restriction Request: responsible for receiving PTN user requests for override of the temporary mode default and passing them on to FE8.

- **FE8** Restriction Control: responsible for determining whether to invoke restriction on behalf of a user in a call, based on the user's service profile and any requests from FE7 for the override of the temporary mode default.

11.1.3 Relationship of functional model to basic call functional model
Figure 15 shows also the relationship with a basic service for SS-CNIR.

11.2 Information flows

11.2.1 Definition of information flows
The information flow RESTRICT shall apply for SS-CNIR.

In table 11 below, the column headed "Request" indicates which of the service elements are mandatory (M) and which are optional (O) in a request/indication information flow. The column headed "Confirm" indicates which of the service elements are mandatory (M) and which are optional (O) in a response/confirmation information flow.

This unconfirmed information flow, which conveys a PTN user to override the SS-CNIR temporary mode default, shall be sent over relationship re. It shall contain the service element listed in table 11.

<table>
<thead>
<tr>
<th>Service elements</th>
<th>Allowed value</th>
<th>Request</th>
<th>Confirm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restriction Indicator</td>
<td>presentation not restricted</td>
<td>M</td>
<td></td>
</tr>
</tbody>
</table>

11.2.2 Relationship of information flows to basic call information flows
When the calling PTN user wishes to override the SS-CNIR temporary mode default, the Restrict request/indication information flow shall be sent at the same time as the basic call information flow SETUP request/indication (r1/r3).

When the called PTN user wishes to override the SS-CNIR temporary mode default, the Restrict request/indication information flow shall be sent at the same time as the basic call information flow SETUP response/confirmation (r1/r3).

*NOTE 16*
If FE8 invokes SS-CNIR on behalf of the calling or called user (automatically or on request from the PTN user), an indication that restriction applies is included in the INFORM 1 request/indication, INFORM 3 request/indication, INFORM 5 request/indication or INFORM 7 request/indication information flow respectively. It is then the responsibility of the FEs of SS-CNIP or SS-CONP to ensure that identification information is not presented to the other user.
11.2.3 Information flow sequences

Signalling procedures shall be provided in support of the information flow sequences specified below. In addition, signalling procedures shall be provided to cover other sequences arising from error situations, interactions with basic call interactions with other supplementary services, different topologies, etc.

In figure 16, SS-CNIR information flows are represented by solid arrows and basic call information flows are represented by broken arrows. An ellipse embracing two information flows indicates that the two information flows occur together. Within a column representing a SS-CNIR functional entity, the numbers refer to functional entity actions listed in 11.3.

Figure 16 shows the information flow sequences for normal operation of SS-CNIR.

![Figure 16 - Information flow sequence for SS-CNIR](image)

### 11.3 Functional entity actions

The following FE actions shall occur at the points indicated in figure 16:

- **FE7 action 701:**
  
  If the served user wishes to override the CNIR temporary mode restriction default, generate a RESTRICT request/indication and send to FE8.

- **FE8 action 801:**
  
  Assign the appropriate presentation restriction indicator to the served user's name identification, based on whether CNIR permanent mode or temporary mode applies and, in the case of temporary mode, whether a request to override the default has been received from FE7.

### 11.4 Functional entity behaviour

Figures 17 and 18 are intended to illustrate typical FE behaviour in terms of information flows sent and received. The figures show the behaviour of the functional entities FE7 and FE8 in providing SS-CNIR using the SDL defined in CCITT Rec. Z.100.

Output signals to the right represent information flows to other functional entities. Input signals from the left represent internal stimuli or input from other functional entities. The relationship to the basic call process is indicated in the annotations.

### 11.5 Allocation of functional entities to physical locations

The allocation of FEs to physical equipment for SS-CNIR as shown in table 12 shall apply. If the served user's TE is stimulus with respect to SS-CNIR, FE7 shall be located in the served user's PTNX.
### Table 12 - Allocation of functional entities to physical location for SS-CNIR

Annex A  
(normative)

Structure and content of a PTN name

The string of characters, which constitutes a name, shall be accompanied by the indication of the type of character set used and, optionally, by an application identifier.

The application identifier is defined as manufacturer-specific information which can imply the structure of the name information.

Various character sets may be used including an application-specific character set which is qualified by manufacturer-specific information. At least one of the specified standard character sets shall be supported by a manufacturer.

The list of possible character sets shall include:
− the 8-bit single-byte coded character set defined in ISO 8859, Part 1: Latin alphabet no.1.
− the character set defined in CCITT Rec. T.61.

Not all of the specified characters in a set have to be implemented by a PTNX or a TE.

Other character sets may be added to the list of possible character sets in future editions of this ECMA Standard.
This Second Edition of Standard ECMA-163 is available free of charge from:
