8 mm Wide Magnetic Tape Cartridge for Information Interchange - Helical Scan Recording AIT-1 with MIC Format
8 mm Wide Magnetic Tape Cartridge for Information Interchange - Helical Scan Recording - AIT-1 With MIC Format
Brief History

Technical Committee ECMA TC17 has produced a series of ECMA Standards for magnetic tape cassettes and cartridges of different widths, e.g. 12.7 mm, 8 mm, 6.35 mm and 3.81 mm. In each series, the standards correspond to specific types of application and user requirements. Enhanced and new media also correspond to advancements in drive technology. The series of helically recorded cartridges with a magnetic tape of 8 mm width comprises the following standards.

- ECMA-145 (1990) 8 mm Wide Magnetic Tape Cartridge for Information Interchange - Helical Recording
  ISO/IEC 11319

- ECMA-169 (1992) 8 mm Wide Magnetic Tape Cartridge - Dual Azimuth Format for Information Interchange - Helical Scan Recording
  ISO/IEC 12246

- ECMA-246 (1996) 8 mm Wide Magnetic Tape Cartridges for Information Interchange - Helical Scan Recording
  ISO/IEC 15780

- ECMA-247 (1996) 8 mm Wide Magnetic Tape Cartridges for Information Interchange - Helical Scan Recording
  ISO/IEC 15718

- ECMA-249 (1996) 8 mm Wide Magnetic Tape Cartridge for Information Interchange - Helical Scan Recording
  ISO/IEC 15757

- ECMA-292 (1999) 8 mm Wide Magnetic Tape Cartridges for Information Interchange - Helical Scan Recording
  ISO/IEC yyyy

- ECMA-293 (1999) 8 mm Wide Magnetic Tape Cartridge for Information Interchange - Helical Scan Recording
  ISO/IEC xxxx

The format of this ECMA Standard is based on, and compatible with, that of Standard ECMA-246. It specifies the use of a Memory In Cartridge (MIC) chip. It provides for a storage capacity of 35 Gbytes uncompressed user data when used with a tape of 230 m.

This ECMA Standard has been contributed to ISO/IEC for adoption under the fast-track procedure as an International Standard.

This ECMA Standard has been adopted by the ECMA General Assembly of 16th December 1999.

Section 1 - General

1 Scope

This ECMA Standard specifies the physical and magnetic characteristics of an 8 mm wide magnetic tape cartridge containing a memory chip to enable physical interchange of such cartridges between drives. It also specifies the quality of the recorded signals, the recording method and the recorded format - called Advanced Intelligent Tape No. 1 with Memory In Cartridge (AIT-1 with MIC) - thereby allowing data interchange between drives by means of such magnetic tape cartridges. The System Log is recorded in the MIC.

This ECMA Standard specifies two types of cartridge depending on the thickness of the magnetic tape contained in the case.

Information interchange between systems also requires, at a minimum, agreement between the interchange parties upon the interchange code(s) and the specifications of the structure and labelling of the information on the interchanged cartridge.

2 Conformance

2.1 Magnetic tape cartridge

A tape cartridge shall be in conformance with this ECMA Standard if it meets all the mandatory requirements specified herein. The tape requirements shall be satisfied throughout the extent of the tape.

2.2 Generating drive

A drive generating a magnetic tape cartridge for interchange shall be in conformance with this ECMA Standard if all recordings on the tape meet the mandatory requirements of this ECMA Standard, and if either or both methods of appending and overwriting are implemented. In addition, such a drive shall be able to record the System Log in the MIC.

A claim of conformance shall state which of the following optional features are implemented and which are not

− the performing of a Read-After-Write check and the recording of any necessary repeated frames;
− the generation of ECC3 Frames.

In addition a claim of conformance shall state

− whether or not one, or more, registered algorithm(s) are implemented within the system and are able to compress data received from the host prior to collecting the data into Basic Groups, and
− the registered identification number(s) of the implemented compression algorithm(s).

2.3 Receiving drive

A drive receiving a magnetic tape cartridge for interchange shall be in conformance with this ECMA Standard if it is able to handle any recording made on the tape according to this ECMA Standard. In particular it shall

− be able to read the System Log recorded in the MIC;
− be able to recognise repeated frames, and to make available to the host, data and Separator Marks from only one of these frames;
− be able to recognise multiple representations of the same Basic Group, and to make available to the host, data and Separator Marks from only one of these representations;
− be able to recognise an ECC3 frame, and ignore it if the system is not capable of using ECC3 check bytes in a process of error correction;
− be able to recognise processed data within an Entity, identify the algorithm used, and make its registered identification number available to the host;
be able to make processed data available to the host. In addition a claim of conformance shall state
– whether or not the system is capable of using ECC3 check bytes in a process of error correction;
– whether or not one or more de-compression algorithm(s) are implemented within the system, and are able to be applied to compressed data prior to making such data available to the host;
– the registered identification number(s) of the compression algorithm(s) for which a complementary de-compression algorithm is implemented.

4 Definitions
For the purposes of this ECMA Standard the following definitions apply.

4.1 Absolute Frame Number (AFN)
A sequence number encoded in a Frame.

4.2 a.c. erase
A process of erasure utilizing magnetic fields of decaying intensity.

4.3 Access
A read or write pass over a partition.

4.4 algorithm
A set of rules for transforming the logical representation of data.

4.5 Area ID
An identifier defining the area of the tape and specifying the types of Frame written.

4.6 Automatic Track Finding (ATF)
The method by which tracking is achieved.

4.7 Average Signal Amplitude
The average peak-to-peak value of the output signal from the read head at the fundamental frequency of the specified physical recording density over a minimum of 20.0 mm of track, exclusive of missing pulses.

4.8 azimuth
The angular deviation made by the mean flux transition line with a line normal to the centreline of the recorded track.

4.9 back surface
The surface of the tape opposite to the magnetic coating which is used to record data.

4.10 byte
An ordered set of bits acted upon as a unit.

4.11 cartridge
A case containing magnetic tape stored on twin hubs.
4.12 Channel bit
A bit after 8-10 transformation.

4.13 Codeword
A word generated by a compression algorithm. The number of bits in a Codeword is variable, and is not specified by this ECMA Standard.

4.14 Early Warning Point (EWP)
A point along the length of the tape at which warning is given of the approach, in the forward direction of the tape motion, of the Partition Boundary or of the Physical End of Tape.

4.15 End of Data (EOD)
The point on the tape at the end of the group which contains the last user data.

4.16 Entity
A unit of recorded data, comprising an Entity Header and a Record sequence.

4.17 Error Correcting Code (ECC)
A mathematical computation yielding check bytes used for the detection and correction of errors.

4.18 flux transition position
That point which exhibits maximum free-space flux density normal to the tape surface.

4.19 flux transition spacing
The distance along a track between successive flux transitions.

4.20 Frame
A pair of adjacent tracks with azimuths of opposite polarity, in which the track with the positive azimuth precedes that with the negative azimuth.

4.21 Housekeeping Frame
A Frame which contains no user data and which is identified as such by the setting of the Data Fields therein.

4.22 Logical Beginning of Tape (LBOT)
The point along the length of the tape where a recording of data for interchange commences.

4.23 magnetic tape
A tape which will accept and retain the magnetic signals intended for input, output and storage purposes on computers and associated equipment.

4.24 Master Standard Amplitude Calibration Tape
A pre-recorded tape on which the standard signal amplitudes have been recorded in the tracks of positive and negative azimuth recorded at a track pitch of 11,0 μm, on an a.c. erased tape.

Note 1
The tape includes recording at 1 428,6 ftpmm, 1 904,8 ftpmm, 2 857,1 ftpmm and 3 809,5 ftpmm.

Note 2
The Master Standard Amplitude Calibration Tape has been established by Sony Corporation.

4.25 Master Standard Reference Tape
A tape selected as the standard for the Reference Recording Field, Signal Amplitude, Resolution, Overwrite and Signal-to-Noise ratio.

Note
The Master Standard Reference Tape has been established by Sony Corporation.
4.26 Memory In Cartridge (MIC)
A chip within the case containing information about the cartridge and its recordings.

4.27 Partition Boundary
The point along the length of a magnetic tape at which a Partition ends and the next Partition commences.

4.28 Physical Beginning of Tape (PBOT)
The point where the leader tape is joined to the magnetic tape.

4.29 Physical End of Tape (PEOT)
The point where the trailer tape is joined to the magnetic tape.

4.30 physical recording density
The number of recorded flux transitions per unit length of track, expressed in flux transitions per millimetre (ftpmm).

4.31 pre-recording condition
The recording levels above which a tape intended for interchange shall not previously have been recorded.

4.32 processing
The use of an algorithm to transform host data into Codewords.

4.33 processed data
A sequence of Codewords which results from the application of processing to data.

4.34 Processed Record
A sequence of Codewords which results from the application of processing to an Unprocessed Record.

4.35 record
Related data treated as a unit of information.

4.36 Reference Field
The Typical Field of the Master Standard Reference Tape.

4.37 Secondary Standard Amplitude Calibration Tape
A tape pre-recorded as specified for the Master Standard Amplitude Calibration Tape the outputs of which are related to those of the Master Standard Amplitude Calibration Tape by calibration factors.

Note
Secondary Standard Amplitude Calibration Tapes can be ordered under Part No. SSCT-AIT-1 from Sony Corporation, RME Company, Data Media Marketing Div. 6-7-35 Kitashinagawa, Shinagawa-ku, Tokyo 141, Japan. In principle such Secondary Standard Amplitude Calibration Tapes will be available for a period of 10 years from the publication of the first Edition of this ECMA Standard. However, by agreement between ECMA and Sony Corporation, this period can be shortened or extended to take into account the demand for such Secondary Standard Amplitude Calibration Tapes.

4.38 Secondary Standard Reference Tape
A tape the outputs of which are related to those of the Master Standard Reference Tape by calibration factors.

Note
Secondary Standard Reference Tapes can be ordered under Part No. SSRT-AIT-1 from Sony Corporation, RME Company, Data Media Marketing Div., 6-7-35 Kitashinagawa, Shinagawa-ku, Tokyo 141, Japan. In principle such Secondary Standard Reference Tapes will be available for a period of 10 years from the publication of the first Edition of this ECMA Standard. However, by agreement between ECMA and Sony Corporation, this period can be shortened or extended to take into account the demand for such Secondary Standard Reference Tapes.

It is intended that these be used for calibrating tertiary reference tapes for use in routine calibration.
4.39 **Separator Mark**
A record containing no user data, which is used to separate data.

4.40 **Standard Reference Amplitude (SRA)**
The Average Signal Amplitude from the tracks of positive azimuth of the Master Standard Amplitude Calibration Tape at a specified physical recording density.

4.41 **Tape Reference Edge**
The bottom edge of the tape when viewing the recording side of the tape, with the PEOT to the observer's right.

4.42 **Typical Field**
In the plot of Average Signal Amplitude against the recording field at the physical recording density of 2 857,1 ft/mm, the field that causes an Average Signal Amplitude equal to 90% of the maximum Average Signal Amplitude.

4.43 **Standard Reference Current**
The current that produces the Reference Field.

4.44 **Test Recording Current**
The current used to record an SRA. It is 1.5 times the Standard Reference Current.

4.45 **track**
A diagonally positioned area on the tape along which a series of magnetic signals may be recorded.

4.46 **unprocessed data**
Data which has not been subjected to processing.

4.47 **Unprocessed Record**
A record of unprocessed data, comprising an integral number of bytes.

5 **Conventions and Notations**

5.1 **Representation of numbers**
A measured value is rounded off to the least significant digit of the corresponding specified value. This implies that, for example, a specified value of 1.26 with a positive tolerance of +0.01 and a negative tolerance of -0.02 allows a range of measured values from 1.235 to 1.275.

The setting of a bit is denoted by ZERO or ONE.

Bit patterns and numbers in binary notation are represented by strings of digits 0 and 1. Within such strings, X may be used to indicate that the setting of a bit is not specified within the string.

Bit patterns and numbers in binary notation are shown with the most significant bit to the left and the least significant bit to the right.

The most significant bit of an 8-bit byte is denoted by b8 and the least significant by b1.

5.2 **Names**
The names of basic elements, e.g. specific fields, are given with a capital initial letter.

7 Environment and safety

7.1 Test environment

Tests and measurements made on the tape cartridge to check the requirements of this ECMA Standard shall be carried out in the following ambient conditions of the air immediately surrounding the drive.

- temperature: 23 °C ± 2 °C
- relative humidity: 40 % to 60 %
- conditioning period before testing: 24 h min.

7.2 Operating environment

Cartridges used for data interchange shall be capable of operating under the following conditions, as measured within 10 mm of the tape exit from the drum of the generating or receiving drive:

- temperature: 5 °C to 45 °C
- relative humidity: 20 % to 80 %
- wet bulb temperature: 26 °C max.

There shall be no deposit of moisture on or in the cartridge.

The above conditions include any temperature rise that may occur while operating the drive.

Conditioning before operating:

If a cartridge has been exposed during storage and/or transportation to a condition outside the above values, before use the cartridge shall be conditioned in the operating environment for a time at least equal to the period during which it has been out of the operating environment, up to a maximum of 24 h.

Note

Rapid variations of temperature should be avoided.

7.3 Storage environment

The following conditions shall be observed during storage:

- temperature: 5°C to 32°C
- relative humidity: 20 % to 60 %

The stray magnetic field at any point on the tape shall not exceed 4000 A/m. There shall be no deposit of moisture on or in the cartridge.

7.4 Transportation

Recommended limits for the environment to which a cartridge may be subjected during transportation, and the precautions to be taken to minimize the possibility of damage, are provided in annex H.
7.5 Safety

The cartridge and its components shall satisfy the requirements of Standard ECMA-287. The cartridge and its components shall not constitute any safety or health hazard when used in the intended manner, or through any foreseeable misuse in an information processing system.

7.6 Flammability

The cartridge and its components shall be made from materials, which if ignited from a match flame, do not continue to burn in a still carbon dioxide atmosphere.

Section 2 - Requirements for the case

8 Dimensional and mechanical characteristics of the case

8.1 General

Dimensional characteristics are specified for those parameters deemed to be mandatory for interchange and compatible use of the cartridge. Where there is freedom of design, only the functional characteristics of the elements described are indicated. In the figures a typical implementation is represented in third angle projection.

Figure 1 is a perspective view of the cartridge seen from the top.
Figure 2 is a perspective view of the cartridge seen from the bottom.
Figure 3 is a perspective view of Reference Planes X, Y and Z.
Figure 4 shows the front side with the lid closed.
Figure 5 shows the left side with the lid closed.
Figure 6 shows the top side with the lid closed.
Figure 7 shows the right side with the lid closed.
Figure 8 shows the rear side with the lid closed.
Figure 9 shows the bottom side, Datum and Support areas.
Figure 10 shows the bottom side with the lid removed.
Figure 11 shows an enlarged view of the Datum and Recognition holes.
Figure 12 shows the cross-sections through the light path holes, the Recognition holes and the Write-inhibit hole.
Figure 13 shows details of the lid when closed, rotating and open.
Figure 14 shows the details of the lid release insertion channel.
Figure 15 shows the lid lock release requirements.
Figure 16 shows the reel lock release requirements.
Figure 17 shows the reel unlock force direction.
Figure 18 shows the lid release force direction.
Figure 19 shows the lid opening force direction.
Figure 20 shows the light path and light window.
Figure 21 shows the internal tape path and light path.
Figure 22 shows the cartridge reel and a cross-section of the cartridge reel.
Figure 23 shows a cross-section of the interface of the cartridge reel with the drive spindle.
Figure 24 shows the tape access cavity clearance.
Figure 25 shows the Access Holes of the MIC on the rear side.
Figure 26 shows the Access Holes of the MIC on the bottom side.

The dimensions are referred to three orthogonal Reference Planes X, Y and Z (see figure 3).

Plane X is perpendicular to Plane Z and passes through the centres of the Datum holes A and B.
Plane Y is perpendicular to Plane X and Plane Z and passes through the centre of Datum hole A.
Datum areas A, B and C lie in Plane Z.

8.2 Overall dimension (figures 5 and 6)

The length of the case shall be

\[ l_1 = 62.5 \text{ mm} \pm 0.3 \text{ mm} \]
The width of the case shall be
\[ l_2 = 95.0 \text{ mm} \pm 0.2 \text{ mm} \]

The distance from the top side of the case to Reference Plane Z shall be
\[ l_3 = 15.0 \text{ mm} \pm 0.2 \text{ mm} \]

The distance from the rear side to Plane X shall be
\[ l_4 = 47.35 \text{ mm} \pm 0.15 \text{ mm} \]

The distance from the right side to Plane Y shall be
\[ l_5 = 13.0 \text{ mm} \pm 0.1 \text{ mm} \]

8.3 Holding areas

The holding areas shown shaded in figure 6 shall be the areas along which the cartridge shall be held down when inserted into the drive. The distance of the holding areas from Plane X shall be
\[ l_6 = 12.0 \text{ mm} \text{ max.} \]

The width when measured from the edges of the case shall be
\[ l_7 = 3.0 \text{ mm} \text{ min.} \]

8.4 Cartridge insertion

The cartridge shall have asymmetrical features to prevent insertion into the drive in other than the correct orientation. These consist of a channel, a recess and an incline.

The channel (figures 4 and 14) shall provide for an unobstructed path, when the lid is closed and locked, to unlock the lid. The distance of the channel from Plane Y shall be
\[ l_8 = 79.6 \text{ mm} \pm 0.2 \text{ mm} \]

There shall be a chamfer at the beginning of the channel defined by
\[ l_9 = 1.0 \text{ mm} \pm 0.1 \text{ mm} \]
\[ l_{16} = 1.5 \text{ mm} \pm 0.1 \text{ mm} \]

An additional chamfer further into the channel shall be defined by
\[ l_{10} = 0.7 \text{ mm} \pm 0.1 \text{ mm} \]
\[ l_{17} = 1.9 \text{ mm} \pm 0.1 \text{ mm} \]
\[ l_{18} = 3.65 \text{ mm} \pm 0.10 \text{ mm} \]

The innermost width of the channel shall be
\[ l_{11} = 1.0 \text{ mm} \text{ min.} \]

There shall be a chamfer on the lid defined by
\[ l_{12} = 1.2 \text{ mm} \pm 0.1 \text{ mm} \]
\[ l_{13} = 0.8 \text{ mm} \pm 0.1 \text{ mm} \]
\[ l_{14} = 1.2 \text{ mm} \pm 0.1 \text{ mm} \]
\[ l_{15} = 0.5 \text{ mm} \pm 0.1 \text{ mm} \]

The distance from the left side of the case to the release pin shall be
\[ l_{19} = 0.2 \text{ mm} \pm 0.2 \text{ mm} \]

The height of the insertion area shall be
\[ l_{20} = 2.3 \text{ mm} \text{ min.} \]
\[ l_{21} = 2.5 \text{ mm} + 0.2 \text{ mm} - 0.0 \text{ mm} \]
The recess is located on the right side of the cartridge. The position and dimensions (figures 7 and 10) shall be defined by

\[ l_{22} = 7.5 \text{ mm max.} \]
\[ l_{23} = 11.0 \text{ mm } \pm \text{ 0.2 mm} \]
\[ l_{24} = 1.5 \text{ mm } \pm \text{ 0.1 mm} \]

The depth of the recess shall be

\[ l_{25} = 1.5 \text{ mm } \pm \text{ 0.1 mm} \]

The incline (figure 13) is part of the lid structure. The distance of the incline from Plane X shall be

\[ l_{26} = 7.7 \text{ mm } \pm \text{ 0.0 mm} \]
\[ -2.5 \text{ mm} \]

The angle of the incline shall be

\[ a_1 = 17.5^\circ \pm 4.0^\circ \]

The incline shall end at its intersection with radius \( r_3 \) (see 8.13).

8.5 Window (figure 1)

A window may be provided on the top side so that parts of the reels are visible. The window, if provided, shall not extend beyond the height of the cartridge.

8.6 Loading grips (figures 5 and 7)

The cartridge shall have a recessed loading grip on the right and on the left side to allow handling by an automatic loading mechanism.

The distance from Plane X to the centreline of the loading grip shall be

\[ l_{28} = 39.35 \text{ mm } \pm \text{ 0.2 mm} \]

The distance of the side edges of the loading grips from Plane Z and from the top side, respectively, shall be

\[ l_{29} = 1.5 \text{ mm } \pm \text{ 0.1 mm} \]

The width of the indent shall be

\[ l_{30} = 5.0 \text{ mm } \pm \text{ 0.3 mm} \]

The depth of the indent shall be

\[ l_{31} = 2.0 \text{ mm } \pm \text{ 0.2 mm} \]

The angle of the indent shall be

\[ a_2 = 90^\circ \pm 5^\circ \]

8.7 Label areas (figures 6 and 8)

A portion of the rear side of the cartridge and a portion of the top side of the cartridge may be used for labels. The portion and the size of the labels shall not interfere with the operation or clearance requirements of the cartridge component parts.

The area used for labels on the top side shall not extend beyond the inner edge of the holding areas defined by \( l_6 \) and \( l_7 \).

The position and dimensions of the label area on the rear side shall be defined by

\[ l_{32} = 0.5 \text{ mm min.} \]
\[ l_{33} = 1.5 \text{ mm min.} \]
\[ l_{34} = 65.0 \text{ mm max.} \]
\[ l_{171} \geq l_{164} \]

The label areas shall not be recessed by more than 0.3 mm.
8.8 Datum areas and Datum holes

The annular Datum areas A, B and C shall lie in Plane Z (see figures 9, 10 and 11). They determine the vertical position of the cartridge in the drive. Each shall have a diameter $d_1 = 6.0 \text{ mm} \pm 0.1 \text{ mm}$ and be concentric with the respective Datum hole.

The centres of Datum holes A and B shall lie in Plane X.

The centre of the circular Datum hole A shall be at the intersection of Planes X and Y (see figure 10).

The distance from the centre of Datum hole B to Plane Y (see figure 9) shall be

$$l_{35} = 68.0 \text{ mm} \pm 0.1 \text{ mm}$$

The distance from the centre of the circular Datum hole C to Plane Y (see figure 11) shall be

$$l_{36} = 10.20 \text{ mm} \pm 0.05 \text{ mm}$$

The distance from the centre of Datum hole D to that of Datum hole C (see figure 9) shall be

$$l_{37} = 89.4 \text{ mm} \pm 0.1 \text{ mm}$$

The distance from the centres of Datum holes C and D to Plane X (see figure 10) shall be

$$l_{38} = 36.35 \text{ mm} \pm 0.08 \text{ mm}$$

The thickness of the case wall in the Datum areas shall be

$$l_{39} = 1.2 \text{ mm} \pm 0.1 \text{ mm}$$

The diameter at the bottom of Datum hole A and Datum hole C shall be

$$l_{40} = 2.6 \text{ mm} \text{ min.}$$

The depth of the holes shall be

$$l_{42} = 4.0 \text{ mm} \text{ min.}$$

The upper diameter of Datum holes A and C shall be

$$l_{44} = 3.00 \text{ mm} \pm 0.05 \text{ mm}$$

This diameter shall be maintained to a depth of

$$l_{41} = 1.5 \text{ mm} \text{ min.}$$

The holes shall be tapered from this depth to the bottom of diameter $l_{40}$.

There shall be a chamfer around the outside of Datum hole A and Datum hole C defined by

$$l_{43} = 0.3 \text{ mm} \text{ max.}$$

$$a_3 = 45^\circ \pm 1^\circ$$

The width at the bottom of Datum holes B and D shall be $l_{40}$.

The depth of these holes shall be $l_{42}$.

The dimensions at the top of these holes shall be

$$l_{45} = 3.5 \text{ mm} \pm 0.1 \text{ mm}$$

$$l_{46} = 3.00 \text{ mm} \pm 0.05 \text{ mm}$$

$$r_1 = 1.7 \text{ mm} \text{ min.}$$

This width shall be maintained to a depth $l_{41}$.

There shall be a chamfer around the outside of Datum holes B and D defined by $l_{43}$ and $a_3$. 
8.9 **Support areas (figure 9)**
The cartridge Support areas are shown shaded in figure 9. Support areas A, B and C shall be coplanar with Datum areas A, B and C, respectively, within 0,1 mm. Support area D shall be coplanar with Datum Plane Z within 0,15 mm.

The areas within \( l_{49} \) of the edge of the cartridge shall be recessed from the Support areas.

\[ l_{49} = 0,5 \text{ mm} \pm 0,1 \text{ mm} \]

The position and dimensions of Support areas A and B shall be defined by

\[ l_{47} = 10,0 \text{ mm} \pm 0,1 \text{ mm (twice)} \]
\[ l_{48} = 11,0 \text{ mm} \pm 0,1 \text{ mm} \]
\[ l_{50} = 7,0 \text{ mm} \pm 0,1 \text{ mm} \]

The distance of Support areas C and D from Plane X shall be

\[ l_{51} = 30,0 \text{ mm} \pm 0,1 \text{ mm} \]

The dimensions of Support areas C and D shall be defined by \( l_{47} \) and

\[ l_{52} = 5,5 \text{ mm} \pm 0,1 \text{ mm} \]
\[ l_{53} = 64,5 \text{ mm} \pm 0,2 \text{ mm} \]

8.10 **Recognition holes (figures 10, 11 and 12)**
There shall be three Recognition holes numbered 1 to 3 as shown in figure 11.

The position of the centre of Recognition hole 1 shall be defined by

\[ l_{54} = 43,35 \text{ mm} \pm 0,15 \text{ mm} \]
\[ l_{55} = 3,7 \text{ mm} \pm 0,1 \text{ mm} \]
\[ l_{56} = 2,3 \text{ mm} \pm 0,1 \text{ mm} \]

The position of the centre of Recognition hole 2 shall be defined by \( l_{54} \) and

\[ l_{61} = 10,0 \text{ mm} \pm 0,1 \text{ mm} \]

Recognition holes 1 and 2 shall be circular, their diameter shall be 3,0 mm ± 0,1 mm. Recognition hole 3 shall have a square form. Its position and dimensions shall be defined by

\[ l_{58} = 74,3 \text{ mm} \pm 0,1 \text{ mm} \]
\[ l_{142} = 77,3 \text{ mm} \pm 0,1 \text{ mm} \]
\[ l_{143} = 41,15 \text{ mm} \pm 0,10 \text{ mm} \]
\[ l_{144} = 44,45 \text{ mm} \pm 0,10 \text{ mm} \]

The depth of a closed Recognition hole below Plane Z (section E-E in figure 12) shall be

\[ l_{59} = 1,2 \text{ mm} \pm 0,3 \text{ mm} \]
\[ - 0,1 \text{ mm} \]

The depth below Plane Z of an open Recognition hole shall be

\[ l_{60} = 5,0 \text{ mm min.} \]

Section E-E shows a Recognition hole closed by a plug. This plug shall withstand an applied force of 0,5 N without being punched out.

This ECMA Standard prescribes the following states of these holes.

- Recognition hole 1 shall be closed
- Recognition hole 2 shall be open
- Recognition hole 3 shall be open

8.11 **Write-inhibit hole (figure 11)**
The centre of the Write-inhibit hole shall be defined by \( l_{54} \) and

\[ l_{57} = 6,4 \text{ mm} \pm 0,1 \text{ mm} \]
The diameter of the hole shall be 3,0 mm ± 0,1 mm.

The depth of a closed Write-inhibit hole below Plane Z shall be \( l_{59} \).

The free space below an open Write-inhibit hole shall be \( l_{60} \) below Plane Z.

When the Write-inhibit hole is open, recording on the tape is inhibited. When it is closed, recording is enabled.

The case may have a movable element allowing the Write-inhibit hole to be opened or closed. If present, this element shall be such that the state of the Write-inhibit hole shall be visible (see figure 8 as an example). The Write-inhibit hole closure shall be constructed so as to withstand a force of 0,5 N. The force required to open or close the Write-inhibit hole shall be between 1 N and 15 N.

8.12 Pre-positioning surfaces (figures 4 and 10)

These surfaces determine the position of the cartridge when it is inserted into the loading slot of the drive.

The distance of the surface on which the Tape Reference Edge rests from Plane Z (figure 4) shall be

\[
l_{62} = 2,4 \text{ mm } + 0,0 \text{ mm } - 0,1 \text{ mm}
\]

The position of the cartridge relative to Plane Y shall be controlled by the pre-positioning surfaces defined by

\[
l_{63} = 1,0 \text{ mm } \pm 0,1 \text{ mm}
\]

\[
l_{64} = 69,0 \text{ mm } \pm 0,2 \text{ mm}
\]

The position of the cartridge relative to Plane X shall be controlled by the pre-positioning surfaces defined by

\[
l_{65} = 14,65 \text{ mm } \pm 0,10 \text{ mm}
\]

The angle of the chamfer at the edge of this surface shall be defined by

\[
a_4 = 45^\circ \pm 1^\circ
\]

8.13 Cartridge lid (figures 6, 13 and 15)

The cartridge shall have a lid for protection of the tape during handling, storage and transportation. The lid consists of two parts, the main part and an auxiliary part.

The main part rotates around an axis A (see figure 13) the position of which is fixed relative to the case. Its location shall be defined by

\[
l_{27} = 0,55 \text{ mm } \pm 0,10 \text{ mm}
\]

\[
l_{67} = 7,5 \text{ mm } \pm 0,1 \text{ mm}
\]

The auxiliary part rotates around axis B the position of which is fixed relative to the main part of the lid and moves with it. When the lid is in the closed position, the location of axis B shall be defined by

\[
l_{68} = 7,0 \text{ mm } \pm 0,1 \text{ mm}
\]

\[
l_{69} = 10,1 \text{ mm } \pm 0,1 \text{ mm}
\]

The rotation of the auxiliary part is controlled by a cam at each end so that it follows the path indicated in figure 13.

In the open position, the front edge of the auxiliary part shall be at a height

\[
l_{70} = 14,8 \text{ mm} \text{ min.}
\]

above Plane Z.

The case shall allow for proper clearance of the lid and auxiliary part defined by

\[
l_{71} = 11,5 \text{ mm } + 0,2 \text{ mm } - 0,0 \text{ mm}
\]

\[
l_{72} = 1,2 \text{ mm } \pm 0,1 \text{ mm}
\]
When the lid is completely open, neither part shall extend beyond a plane parallel to Plane Z located above it at a height
\[ l_{73} = 22.3 \text{ mm max.} \]

When the lid is in its completely open position, its front edge shall have been rotated by an angle defined by
\[ a_5 = 85^\circ + 1^\circ - 2^\circ \]

When the lid is in partially open position, neither part shall extend beyond a plane parallel to Plane Z located above it at a height
\[ l_{74} = 22.5 \text{ mm max.} \]

The path of the top of the lid as it opens shall be defined by
\[ r_2 = 14.9 \text{ mm max.} \]

The start point of the incline on the case that meets the lid (figure 6) shall be defined by
\[ l_{75} = 8.4 \text{ mm max.} \]

In the closed position of the lid, its height over Plane Z (figure 13) shall be
\[ l_{76} = 15.2 \text{ mm } + 0.0 \text{ mm} - 0.5 \text{ mm} \]

and its distance from Plane X shall be
\[ l_{77} = 15.3 \text{ mm } + 0.0 \text{ mm} - 0.3 \text{ mm} \]

In the closed position of the lid, its inside shall provide a clearance for the tape defined by
\[ l_{78} = 13.15 \text{ mm } \pm 0.10 \text{ mm} \]

The top front of the lid shall be convex. The centre of the corresponding radius shall be on axis A. This radius shall be
\[ r_3 = 14.7 \text{ mm max.} \]

The design of the locking mechanism is not specified by this ECMA Standard except that it shall be operated by a release pin located in the drive. In the closed and locked position of the lid, access to the lid lock release shall be unobstructed in the shaded area (see figure 15) defined by
\[ l_{79} = 2.0 \text{ mm } \pm 0.1 \text{ mm} \]
\[ l_{145} = 6.3 \text{ mm } \pm 0.2 \text{ mm} \]
\[ l_{146} = 1.2 \text{ mm } \pm 0.1 \text{ mm} \]
\[ a_{15} = 45^\circ \pm 1^\circ \]
\[ a_{16} = 15^\circ \pm 1^\circ \]

The release mechanism of the lid shall be actuated when the drive release pin is in the other shaded area of figure 15 defined by \( l_{79} \) and
\[ l_{80} = 8.2 \text{ mm } \pm 0.2 \text{ mm} \]
\[ l_{81} = 0.7 \text{ mm } \pm 0.2 \text{ mm} \]
\[ a_6 = 15^\circ \pm 1^\circ \]

The force required to unlock the lid lock shall not exceed 0.25 N in the direction shown in figure 18.
The force required to open the lid shall not exceed 1.0 N in the direction shown in figure 19.
8.14 Cartridge reel lock (figures 10 and 16)
The reels shall be locked when the cartridge is removed from the tape drive. The design of the locking mechanism is not specified by this ECMA Standard except that it shall meet the requirements specified below so as being able to be operated by a release pin of the drive.

The release mechanism shall be accessed through a rectangular hole of the case (figure 10) which shall be defined as follows.

− its centreline shall be parallel to Plane Y at a distance
  \[ l_{82} = 34.5 \text{ mm} \pm 0.1 \text{ mm} \]
− its top edge shall be parallel to Plane X at a distance
  \[ l_{83} = 35.85 \text{ mm} \pm 0.15 \text{ mm} \]
− its width shall be
  \[ l_{84} = 4.0 \text{ mm} \pm 0.1 \text{ mm} \]
− its height shall be
  \[ l_{85} = 6.5 \text{ mm} \text{ min.} \]

The dimension of the release mechanism shall be defined by

\[ l_{86} = 3.2 \text{ mm} \]
\[ + 0.3 \text{ mm} \]
\[ - 0.2 \text{ mm} \]
\[ l_{87} = 4.0 \text{ mm} \pm 0.1 \text{ mm} \]
\[ \alpha_7 = 60.0^\circ \pm 1.0^\circ \]

The reels shall be locked when the operating face of the release pin is located at a distance from Plane X defined by

\[ l_{88} = 39.0 \text{ mm} \]
\[ + 2.0 \text{ mm} \]
\[ - 0.0 \text{ mm} \]

The reels shall be unlocked when the operating face of the release pin is located at a distance from Plane X defined by

\[ l_{89} = 41.75 \text{ mm} \]
\[ + 0.50 \text{ mm} \]
\[ - 0.00 \text{ mm} \]

In this position there shall be a clearance between the locking mechanism and the inside of the rear wall of the cartridge defined by

\[ l_{90} = 0.5 \text{ mm} \text{ min.} \]

The pin used to move the locking mechanism shall penetrate into the cartridge over a distance of

\[ l_{91} = 7.8 \text{ mm max.} \]

and the bottom edge of the slanted part of the pin shall penetrate over a distance of \( l_{86} \text{ min.} \)

The rectangular cavity of the locking mechanism shall be defined by

\[ l_{92} = 4.0 \text{ mm} \pm 0.1 \text{ mm} \]
\[ r_4 = 0.3 \text{ mm max.} \]

The force required to unlock the reel lock in the direction shown in figure 17 shall not exceed 1.0 N.

8.15 Reel access holes (figure 10)
The case shall have two circular reel access holes which shall allow penetration of the drive spindles.

The positions of the access holes shall be defined by

\[ l_{93} = 23.00 \text{ mm} \pm 0.05 \text{ mm} \]
The diameter of the holes shall be

\[ d_2 = 18.80 \text{ mm} \pm 0.05 \text{ mm} \]

8.16 Interface between the reels and the drive spindles

The drive spindles (see figures 22 and 23) shall engage the reels in the area defined by

\[ l_{102} = 5.4 \text{ mm} \pm 0.1 \text{ mm} \]
\[ l_{103} = 4.4 \text{ mm} \pm 0.1 \text{ mm} \]
\[ l_{104} = 0.6 \text{ mm} \text{ max.} \]
\[ d_4 = 10.00 \text{ mm} \pm 0.08 \text{ mm} \]
\[ d_5 = 16.0 \text{ mm} \text{ max.} \]
\[ d_6 = 18.0 \text{ mm} \pm 0.1 \text{ mm} \]
\[ d_7 = 16.0 \text{ mm} \pm 0.1 \text{ mm} \]

The reel engagement hole shall have a chamfer defined by

\[ l_{105} = 2.4 \text{ mm} \pm 0.1 \text{ mm} \]
\[ a_9 = 15^\circ \pm 1^\circ \]

The bottom of the reel on the outside edge shall have a chamfer defined by

\[ l_{106} = 0.2 \text{ mm} \text{ max.} \]
\[ a_8 = 45^\circ \pm 1^\circ \]

The position and width of the slots with which the drive spindle will engage shall be defined by

\[ l_{107} = 2.4 \text{ mm} \pm 0.2 \text{ mm} \]
\[ a_{10} = 60^\circ \pm 1^\circ \]

The teeth in the reel engagement hole shall have a radius

\[ r_5 = 0.2 \text{ mm} \text{ max.} \]

The depth of the reel driving hole within diameter \( d_3 \) shall be

\[ l_{108} = 9.4 \text{ mm} \text{ min.} \]
\[ d_3 = 6.50 \text{ mm} \pm 0.08 \text{ mm} \]

When the cartridge is within the drive, the tape centre line shall be in a plane parallel to Plane Z at a distance

\[ l_{109} = 7.05 \text{ mm} \pm 0.10 \text{ mm} \]

and the Support areas of the reels shall be at a distance from Plane Z defined by

\[ l_{110} = 0.6 \text{ mm} \pm 0.2 \text{ mm} \]

The penetration of the reel drive spindle into the reel shall be defined by

\[ l_{111} = 7.5 \text{ mm} \text{ max.} \]
\[ l_{112} = 8.0 \text{ mm} \text{ max.} \]
\[ a_{11} = 60^\circ \pm 1^\circ \]
When the cartridge is mounted within the drive, so that the Support areas are at a distance $l_{110}$ from Plane Z, a force $F = 0,6 \text{ N} \pm 0,2 \text{ N}$ shall be exerted on the cartridge in the direction shown in figure 23.

8.17 Light path (figures 10, 12, 20 and 21)
A light path shall be provided for sensing the leader and trailer tapes. When the lid is open, an unobstructed light path shall exist from the $d_{10}$ diameter light path hole to the outside of the cartridge via square windows in the light path hole (see cross-section D-D in figure 12) and the light window in the cartridge lid.

The centre of the light path hole shall be defined by $l_{92}$ and

$$l_{115} = 8,35 \text{ mm} \pm 0,10 \text{ mm}$$

The diameter of the light path hole shall be

$$d_{10} = 6,5 \text{ mm} \pm 0,3 \text{ mm}$$

The light path hole shall have a chamfer defined by

$$l_{116} = 0,5 \text{ mm max.}$$

$$a_{12} = 45^\circ \pm 1^\circ$$

The position and size of the square window on each side of the light path hole shall be defined by

$$l_{117} = 6,05 \text{ mm} \pm 0,10 \text{ mm}$$
$$l_{118} = 2,5 \text{ mm} \pm 0,0 \text{ mm}$$

where $l_{118}$ is the length of the side of the square window.

The hole shall be deep enough to allow penetration of a light emitter over a distance of

$$l_{119} = 12,5 \text{ mm min.}$$

The angle of the light path shall be

$$a_{13} = 5,50^\circ \pm 0,25^\circ$$

The position and size of the cartridge lid window shall be

$$l_{120} = 3,8 \text{ mm} \pm 0,1 \text{ mm}$$
$$l_{121} = 2,5 \text{ mm} \pm 0,0 \text{ mm}$$

$$l_{122} = 6,05 \text{ mm} \pm 0,10 \text{ mm}$$

8.18 Position of the tape in the case (figure 21)
The tape shall run between two guide surfaces in a plane parallel to Plane X and $l_{123}$ from it.

$$l_{123} = 13,15 \text{ mm} \pm 0,10 \text{ mm}$$

The guide surfaces shall have a radius of $r_6$ and shall be tangential, as shown in figure 21, to lines tangential to the reel hubs that extend to points outside the case.

$$r_6 = 3,0 \text{ mm} \pm 0,1 \text{ mm}$$

These points shall be defined by

$$l_{124} = 76,28 \text{ mm} \pm 0,30 \text{ mm}$$
$$l_{125} = 27,15 \text{ mm} \pm 0,20 \text{ mm}$$
$$l_{126} = 31,15 \text{ mm} \pm 0,20 \text{ mm}$$
$$l_{127} = 9,67 \text{ mm} \pm 0,10 \text{ mm}$$
8.19 **Tape path zone**

When the cartridge is inserted into the drive, the tape is pulled outside the case by tape guides and is no longer in contact with the guide surfaces. The tape path zone (see figure 21) of the case is the zone in which the tape shall be able to move freely. This zone shall be maintained for both sides of the case and shall be defined by \( l_{124} \) to \( l_{127} \) and

\[
\begin{align*}
l_{128} &= 23.0 \text{ mm ± 0.1 mm} \\
l_{130} &= 46.2 \text{ mm ± 0.2 mm} \\
l_{131} &= 11.4 \text{ mm ± 0.1 mm}
\end{align*}
\]

The clearance between the tape and the guides shall be defined by

\[
\begin{align*}
l_{129} &= 0.3 \text{ mm min.} \\
l_{132} &= 0.3 \text{ mm min.}
\end{align*}
\]

8.20 **Tape access cavity (figure 10)**

When the cartridge is inserted into the drive, tape guides in the drive pull the tape into the drive tape path. The two radii \( r_7 \) are centred on Datum holes A and B. The shape and dimensions of the access cavity for these tape guides shall be defined by \( l_{63} \) and \( l_{64} \), and the following

\[
\begin{align*}
r_7 &= 2.3 \text{ mm ± 0.1 mm}
\end{align*}
\]

The two radii \( r_8 \) are centred on the centres of the reel access holes.

\[
\begin{align*}
r_8 &= 24.15 \text{ mm ± 0.10 mm} \\
l_{133} &= 3.85 \text{ mm ± 0.10 mm}
\end{align*}
\]

8.21 **Tape access cavity clearance (figure 24)**

The case design shall provide clearance for drive tape threading mechanisms. This clearance shall be defined by

\[
\begin{align*}
l_{134} &= 1.2 \text{ mm max.} \\
l_{135} &= 1.15 \text{ mm} + 0.20 \text{ mm} \\
l_{136} &= 14.0 \text{ mm} - 0.00 \text{ mm} + 0.0 \text{ mm} \\
l_{137} &= 66.8 \text{ mm min.} \\
l_{138} &= 10.0 \text{ mm min.} \\
l_{139} &= 66.8 \text{ mm min.} \\
l_{140} &= 1.2 \text{ mm max.} \\
\alpha_{14} &= 49^\circ \text{ max.} \\
l_{141} &= 14.8 \text{ mm min.} \\
l_{159} &= 13.0 \text{ mm min.} \\
l_{170} &= 4.0 \text{ mm max.}
\end{align*}
\]

8.22 **Requirements for the MIC (figures 25 and 26)**

The MIC shall be a chip built into the case (See annex L). It can be accessed through five Access Holes. The MIC shall be mounted in the case so that, when inserted into the drive, the contacts of the drive match those of the MIC when they penetrate into the five Access Holes by at least 1.70 mm. The interface shall be I²C™. The capacity of the MIC shall be indicated on the top side of the case.

The positions and dimensions of these Access Holes are as follows.

Access Hole GND

\[
\begin{align*}
l_{165} &= 67.2 \text{ mm} + 0.0 \text{ mm} - 0.2 \text{ mm}
\end{align*}
\]
Access Hole SCL

\[ l_{166} = 69.0 \text{ mm} \]
\[ +0.2 \text{ mm} \]
\[ -0.0 \text{ mm} \]

Access Hole ID

\[ l_{169} = 72.8 \text{ mm} \]
\[ +0.0 \text{ mm} \]
\[ -0.2 \text{ mm} \]
\[ +0.2 \text{ mm} \]

Access Hole SDA

\[ l_{148} = 75.6 \text{ mm} \]
\[ +0.0 \text{ mm} \]
\[ -0.2 \text{ mm} \]
\[ +0.2 \text{ mm} \]

Access Hole Vcc

\[ l_{150} = 78.4 \text{ mm} \]
\[ +0.0 \text{ mm} \]
\[ -0.2 \text{ mm} \]
\[ +0.2 \text{ mm} \]

The following dimensions shall apply to all Access Holes.

\[ l_{152} = 5.1 \text{ mm} \]
\[ +0.2 \text{ mm} \]
\[ -0.0 \text{ mm} \]
\[ +0.3 \text{ mm} \]

\[ l_{153} = 1.4 \text{ mm} \]
\[ +0.1 \text{ mm} \]

There shall be a chamfer around the outside of these holes defined by

\[ l_{154} = 0.4 \text{ mm} \pm 0.1 \text{ mm} \]

\[ a_{17} = 45^\circ \pm 1^\circ \]

When the cartridge is inserted into the drive, the pin used to recognise the cartridge penetrates through Recognition hole 3. The cavity shown shaded in cross-section N-N in figure 26 is required for this pin. This cavity shall be defined by \( l_{143}, l_{144} \) and

\[ l_{157} = 5.0 \text{ mm min.} \]
\( l_{158} = 1,5 \text{ mm max.} \)
\( l_{160} = 45,4 \text{ mm min.} \)

### 8.23 Recognition recesses (figures 8 and 10)

The cartridge shall have two recesses on the rear side. These recesses are used to recognise the cartridge in a library system. They shall be defined by

\[
\begin{align*}
l_{161} &= 8,4 \text{ mm} \\
&\quad + 0.0 \text{ mm} \\
&\quad - 0.2 \text{ mm} \\
\end{align*}
\]

\[
\begin{align*}
l_{162} &= 6,0 \text{ mm} \\
&\quad + 0.2 \text{ mm} \\
&\quad - 0.0 \text{ mm} \\
\end{align*}
\]

\[
\begin{align*}
l_{163} &= 2,0 \text{ mm} \\
&\quad + 0.2 \text{ mm} \\
&\quad - 0.0 \text{ mm} \\
\end{align*}
\]

\[
\begin{align*}
l_{164} &= 2,0 \text{ mm} \\
&\quad + 0.2 \text{ mm} \\
&\quad - 0.1 \text{ mm} \\
\end{align*}
\]

Section 3 - Requirements for the unrecorded tape

9 Mechanical, physical and dimensional characteristics of the tape

This ECMA Standard specifies two types of cartridge depending on the thickness of the tape.

Type A: The nominal thickness of the tape shall be 7.0 \( \mu \)m.
Type B: The nominal thickness of the tape shall be 5.2 \( \mu \)m.

9.1 Materials

The recordable area of the tape shall consist of a base material coated on one side with a strong yet flexible layer of evaporated metal material or equivalent. The back surface may be coated. The base material shall be

For Type A: An oriented polyethylene terephthalate film or equivalent
For Type B: A polyaramid film or equivalent

There shall be a leader tape between the take-up hub and PBOT. There shall be a trailer tape between PEOT and the supply hub. The leader and trailer tapes shall consist of a translucent length of the same oriented polyethylene terephthalate or an equivalent base material.

The leader and trailer tapes shall each be attached to the magnetic tape by means of a length of splicing tape which extends over each such joint. The splicing tape shall consist of polyethylene terephthalate (or equivalent), coated on one side with an acrylic (or equivalent) adhesive material.

9.2 Tape length

9.2.1 Length of the magnetic tape

The length of the tape shall be measured between PBOT and PEOT.

Type A: The length of the tape shall be in the range 5.0 m to 170.0 m.
Type B: The length of the tape shall be in the range 5.0 m to 230.0 m.

9.2.2 Length of the leader and trailer tapes

The length of the leader and trailer tapes shall be in the range 70 mm to 90 mm. The joints between the leader and trailer tapes and the magnetic tape shall be perpendicular to the Tape Reference Edge within 1°.

9.2.3 Length of the splicing tapes

The length of the splicing tapes shall be 13 mm max. They shall extend for a distance of 6.5 mm ± 1.5 mm over the leader and trailer tapes.

9.3 Tape width

9.3.1 Width of the magnetic, leader and trailer tapes

The width of the magnetic tape shall be 8.00 mm ± 0.01 mm. The difference between the largest and smallest width shall not exceed 6 \( \mu \)m peak-to-peak.

The width of the leader tape and of the trailer tape shall be 8.00 mm ± 0.02 mm.

Procedure

a) Cover a section of the tape with a glass microscope slide.

b) Measure the width from edge to edge with no tension applied to the tape using a calibrated microscope, profile projector, or equivalent having an accuracy of at least 2.5 \( \mu \)m.

c) Repeat the measurement to obtain tape widths at a minimum of five different positions along a minimum tape length of 1.0 m.

The tape width is the average of the widths measured.
9.3.2 Width and position of the splicing tape
The width of the splicing tape and its position across the width of the leader, trailer and magnetic tapes shall be such that the bottom edge of the splicing tape shall be not more than 0.6 mm from the bottom edges of the other tapes, and the top edge of the splicing tape shall be not more than 0.6 mm from their top edges. Neither edge of the splicing tape shall extend beyond the edges of the leader, trailer and magnetic tapes.

9.4 Discontinuities
Between PBOT and PEOT there shall be no discontinuities in the magnetic tape such as those produced by tape splicing or perforations.

9.5 Tape thickness
9.5.1 Thickness of the magnetic tape
The thickness of the magnetic tape at any point shall be:
For Type A: In the range 6.5 µm to 7.3 µm.
For Type B: In the range 5.0 µm to 5.5 µm.

9.5.2 Thickness of the leader and trailer tapes
The thickness of the leader and trailer tapes at any point shall be in the range 9 µm to 17 µm.

9.5.3 Thickness of the splicing tape
The thickness of the splicing tape at any point shall be 27 µm max.

9.6 Longitudinal curvature
The radius of curvature of the edge of the tape shall be 33 m min.

Procedure
Allow a 1.0 m length of tape to unroll and assume its natural curvature on a flat smooth surface. Measure the deviation from a 1.0 m chord. The deviation shall not be greater than 3.8 mm. This deviation corresponds to the minimum radius of curvature of 33 m if measured over an arc of a circle.

9.7 Cupping
The departure across the width of tape from a flat surface shall be 0.7 mm max.

Procedure:

a) Cut a 150 mm ± 10 mm length of tape.
b) Condition the tape for a minimum of 3 h in the test environment by hanging it so that the coated surface is freely exposed to the test environment.
c) Lay the tape across two cylindrical guides that are placed horizontally with the centres 35 mm apart.
d) Attach a 0.3 g mass to each end of the tape.
e) Measure the distance between the plane established by the edges of the tape and the maximum deviation from the plane.

9.8 Coating adhesion
The force required to peel any part of the coating from the tape base material shall be 0.1 N min.

Procedure

a) Take a test piece of the tape approximately 380 mm long and scribe a line through the coating across the width of the tape 125 mm from one end.
b) Using a double-sided pressure sensitive tape, attach the test piece to a smooth metal plate, with the coated surface facing the plate, as shown in figure 27.
c) Fold the test piece over 180° adjacent to, and parallel with the scribed line. Attach the metal plate and the free end of the test piece to the jaws of a universal testing machine such that when the jaws are separated the tape is peeled. Set the jaw separation rate to 254 mm/min.

d) Note the force at which any part of the coating first separates from the base material. If this is less than 0.1 N, the tape has failed the test. If the test piece peels away from the double-sided pressure sensitive tape before the force exceeds 0.1 N, an alternative type of double-sided pressure tape shall be used.

If the back surface of the tape is coated, repeat the procedure for the back coating.

Figure 27 - Measurement of the coating adhesion

9.9 Layer-to-layer adhesion

There shall be no tendency for the test piece to stick or for the coating to peel.

Procedure

a) Attach one end of a test piece of magnetic tape of 1 m length to the surface of a glass tube of 36 mm in diameter.
b) Wind the tape onto the tube at a tension of 1.1 N.
c) Store the wound test piece in a temperature of 45 °C ± 3 °C and a relative humidity of 80 % for 4 h.
d) Store for a further 24 h in the testing environment.
e) Apply a force of 0.1 N to the free end of the test piece and allow it to unwind slowly.

9.10 Tensile strength

Measurements shall be made in accordance with ISO/R 527. The length of the test piece shall be 200 mm. The length of the leader tape test piece shall be 50 mm. The length of the trailer tape test piece shall be 50 mm. The rate of elongation for all tensile tests shall be 100 mm/min - ISO/R 527, Rate D.

9.10.1 Breaking strength

The breaking strength of the tape shall be 8 N min.

Procedure

Load the test piece until the breaking point is reached. The force required to reach that point is the breaking strength.

9.10.2 Yield strength

The yield strength is the force required to produce a 5 % elongation of the tape.

The yield strength shall be 4 N min.

9.11 Residual elongation

The residual elongation, expressed as a percentage of the original length, shall be less than 0.04 %.

Procedure

a) Measure the initial length of a test piece of approximately 1 m with a maximum applied force of 0.20 N.
b) Apply an additional force per total cross-sectional area of 20.5 N/mm² for a period of 10 minutes.
c) Remove the additional force and measure the length after 10 minutes.

9.12 Electrical resistance of the recording surface
The electrical resistance of any square area of the recording surface shall be \(10^3\ \Omega\) max.

Procedure
a) Condition a test piece of tape in the test environment for 24 h.

b) Position the test piece over two 24-carat gold-plated, semicircular electrodes having a radius \(r = 10\ mm\) and a finish of at least N4, so that the recording surface is in contact with each electrode. These electrodes shall be placed parallel to the ground and parallel to each other at a distance \(d = 8\ mm\) between their centres (see figure 28).

c) Apply the force necessary to produce a tension of \(5\ N/mm^2\) to each end of the test piece.

d) Apply a d.c. voltage of \(7\ V \pm 1\ V\) across the electrodes and measure the resulting current flow. From this value, determine the electrical resistance.

Repeat for a total of five positions along the test piece and average the five resistance readings.

When mounting the test piece ensure that no conducting paths exist between the electrodes except that through the coating under test.

Note
Particular attention should be given to keeping the surfaces clean.

![Figure 28 - Measurement of electrical resistance](image)

9.13 Tape winding
The magnetic surface of the tape shall face outward from the cartridge and reels.

9.14 Light transmittance of the tape
The light transmittance of the magnetic tape shall be 5 % max.

The light transmittance of the leader and trailer tapes shall be 60 % min.

The method for measuring light transmittance is given in annex A.

10 Magnetic recording characteristics
The magnetic recording characteristics shall be defined by the testing requirements given below.

When performing these tests, the output or resultant signal shall be measured on a read-while-write pass for both a tape calibrated to the Master Standard Reference Tape and the tape under test, on the same equipment.

The following conditions shall apply to the testing of all magnetic recording characteristics, unless otherwise stated.
tape condition : a.c. erased to a level of less than 0.1 % of the Average Signal Amplitude at 2 857.1 ftpmm.

diameter of the scanner : 40.00 mm ± 0.01 mm

rotation speed of the scanner : 4 800.0 rpm ± 0.5 rpm

tape speed : 20.63 mm/s ± 0.30 mm/s

test tracks : Positive azimuth

read gap length : 0.20 µm ± 0.05 µm

recording current : Test Recording Current

recorded track width : 11 µm ± 1 µm

tape tension : 0.050 N ± 0.005 N measured at the input of the scanner

write gap length : 0.22 µm ± 0.05 µm

read head track width : 13 µm to 15 µm

read head setting during a read pass : the read head shall cover the whole width of the recorded track

read output level : taken at the appropriate fundamental frequency

10.1 Typical Field
The Typical Field shall be between 80 % and 112 % of the Recording Field.

Traceability to the Reference Field is provided by the calibration factor supplied with each Secondary Standard Reference Tape.

10.2 Signal Amplitude
The Average Signal Amplitude at the physical recording density of 3 809.5 ftpmm shall be between 90 % and 140 % of that for the Master Standard Reference Tape.

The Average Signal Amplitude at the physical recording density of 1 428.6 ftpmm shall be between 90 % and 130 % of that for the Master Standard Reference Tape.

Traceability to the Average Signal Amplitude of the Master Standard Reference Tape is provided by the calibration factors supplied with each Secondary Standard Reference Tape.

10.3 Resolution
The ratio of the Average Signal Amplitude at the physical recording density of 3 809.5 ftpmm to that at the physical recording density of 1 428.6 ftpmm shall be between 85 % and 120 % of the same ratio for the Master Standard Reference Tape.

Traceability to the resolution for the Master Standard Reference Tape is provided by the calibration factors supplied with each Secondary Standard Reference Tape.

10.4 Overwrite
Overwrite is the ratio of the Average Signal amplitude of the residual of a low density recording after overwriting at a higher density to the Average Signal Amplitude of the original low density recording.

Traceability to the overwrite ratio for the Master Standard Reference Tape is provided by the calibration factors supplied with each Secondary Standard Reference Tape.

Procedure
a.c. erase the tape. Record at the physical density of 1 142.9 ftpmm and measure the Average Signal Amplitude. Overwrite at the physical recording density of 5 714.3 ftpmm and measure the Average Signal Amplitude of the residual 1 142.9 ftpmm signal. Repeat for the Secondary Standard Reference Tape.
**Requirement**

The ratio = \[
\frac{\text{Residual Average Signal Amplitude at 1 142.9 ftpmm after overwriting}}{-\text{Average Signal Amplitude of the original recording at 1 142.9 ftpmm}}
\]

shall be less than 120 % of the same ratio for the Master Standard Reference Tape.

10.5 **Ease of erasure**

When a tape has been recorded at 1 142.9 ftpmm with the Test Recording Current and then passed through a longitudinal steady erasing field of 320 000 A/m, any remaining signal shall not exceed 2 % of the Standard Reference Amplitude for that density. The erasing field shall be reasonably uniform, for example, the field in the middle of a solenoid. This measurement shall be made with a band pass filter passing at least the first three harmonics.

10.6 **Tape quality**

10.6.1 **Missing pulses**

A missing pulse is a loss of read signal amplitude. A missing pulse exists when the base-to-peak read signal is 40 %, or less, of half the Average Signal Amplitude for the recording density of 1 428.6 ftpmm on the same tape.

10.6.2 **Missing pulse zone**

A missing pulse zone commences with a missing pulse and ends when a length of 1 mm of track has been measured. If a missing pulse zone continues for a distance exceeding 1 mm, a new missing pulse zone commences.

A missing pulse zone does not continue from one track to the next.

The missing pulse zone rate shall be less than 1 in 5 x 10^6 flux transitions and applies to both positive and negative azimuth tracks.

10.7 **Signal-to-Noise Ratio (SNR) characteristic**

The Signal-to-Noise Ratio is the average rms read signal amplitude divided by the average integrated rms noise amplitude, and expressed in decibels.

\[
\text{SNR} = 20 \log \frac{\text{Average rms read signal amplitude}}{\text{Average integrated rms noise amplitude}} \quad \text{dB}
\]

**Requirement**

The SNR for the tape under test (SNR_{tape}) shall be better than -2 dB relative to the SNR for the Master Standard Reference Tape (SNR_{MSRT}) when measured according to the procedure defined in annex B.

Traceability to the SNR_{MSRT} is provided by the calibration factor supplied with each Secondary Standard Reference Tape.

**Section 4 - Requirements for an interchanged tape**

11 **Format**

11.1 **General**

The smallest collection of data supported by the format is a record. A record is the smallest distinct set of data bytes supplied, e.g. from a host, for processing and recording by a tape drive system, and the smallest distinct set of data to be read from tape, reprocessed and made available, e.g. to a host, by a tape drive system. Two types of record are supported, namely Processed Records and Unprocessed Records.

A recorded tape shall contain Unprocessed Records or Processed Records or both. It may also contain Separator Marks. Both Processed Records and Unprocessed Records are stored on tape as Entities.
Separator Marks may be used by the host to indicate the logical separation(s) of the data within a structuring scheme.

Entities and Separator Marks are collected into groups. An index within each group describes that group's contents. A series of transformations, namely randomizing, interleaving, blocking, the generation and inclusion of two Reed-Solomon error correcting codes, and the translation of bytes to Channel bits, is applied to each group prior to recording. A third Reed-Solomon error correcting code may be applied to the group; in this case, the resulting bytes are transformed and recorded in the frames that follow the group on the tape.

Each group is recorded on a group of tracks. The part of each track in which the user data, Separator Marks and associated information are recorded is called the Main Data Zone of the track. Additional information about the contents of the group, the location of the track(s) and the contents of the track(s) is recorded in the Headers of the Recorded Data Blocks in the ID Area of the Main Data Zone.

In the following description all operations on the data received from the host computer, including the use of error detecting and correcting codes, but excluding processing, are described. Then the method of recording on the tape and the tape layout itself will be described. However, because of the inherent characteristics of this format, where required, advance references to the tape layout will also be made in the course of the description of the operations on the data.

11.2 Basic Groups

The data to be recorded shall be grouped in Basic Groups of 801 792 bytes. Each Basic Group shall be identified by a running number allocated consecutively starting with 0. In each Basic Group the bytes are identified by a running number from 1 to 801 792.

The structure of Basic Group No. 0 is not specified by this ECMA Standard. The data for this group is generated by the tape system. It is recorded as the Vendor Group, (see annex K).

Data and Separator Marks received from the host computer shall be grouped in Basic Groups, following Basic Group No. 0, starting with Basic Group No. 1. These Basic Groups shall be structured as follows.

*Note*

In this ECMA Standard, there are two types of Separator Marks which are referred to as Separator 1 and Separator 2. Some other standards, e.g. those which define an interface between a tape drive and a host computer, use the terms “file mark” and “set mark” to denote Separator Marks. It is recommended that Separator 1 be equated to file mark and Separator 2 be equated to set mark.
Data constituting Entities shall progress into the Basic Group from left to right (as seen in figure 29). At the same time a part of the Basic Group, called the Block Access Table (BAT), shall progress from right to left. The Group Information Table (GIT) shall occupy the last 40 bytes of the Basic Group.

11.2.1 Entity

11.2.1.1 Content

An Entity comprises an Entity Header and a sequence of consecutive Records. The Entity Header shall be 8 bytes in length. It shall precede the first or single Record of the Entity.

All Processed Records in an Entity shall be the result of applying the same processing algorithm to Unprocessed Records of equal length. All Unprocessed Records in an Entity shall be of equal length.

An Entity may span Basic Groups, provided that all of the Entity Header and the first 8 bits of the first or single Record of the Entity are within the same Basic Group.

In the case where an Entity spans Basic Groups, the parts thereof, within each Basic Group, are identified as Start Part of Entity, Middle Part of Entity and Last Part of Entity (See 11.2.3.2, to 11.2.3.4).

An Entity shall not contain a Record that does not contain data for interchange.

11.2.1.2 Entity Header

Byte No. 1 is the first byte in the Entity Header, and Byte No. 8 is the last byte in the Entity Header, i.e. is adjacent to the first or single Record of the Entity. The Entity Header shall have the following layout:

Byte No. 1 This byte shall be set to 0000 1000, specifying the number of bytes of the Entity Header, viz. 8.

Byte No. 2 This byte shall be set as follows:
- if the record is an Unprocessed Record, this byte shall be set to the value 1;
- if the record is a Processed Record, this byte shall be set to
  · the value in the range 2 to 254 corresponding to the registered identifier according to ISO/IEC 11576 of the processing algorithm applied to the record,
  · the value 255, if the processing algorithm is not registered.

This byte shall not be set to the value 0.

Bytes No. 3 to 5 shall specify in binary notation the length in bytes of the Record before processing, if any (see 11.2.1.1, 2nd paragraph). This length shall not equal 0. Byte No. 3 shall be the MSB, Byte No. 5 shall be the LSB.

Bytes No. 6 to 8 shall specify in binary notation the number of Records in the Entity. This number shall not equal 0. Byte No. 6 shall be the MSB, Byte No. 8 the LSB.

11.2.2 Group Information Table

The Group Information Table shall be a 40-byte field, and shall have the layout shown in table 1.
<table>

</tbody>
</table>

Within each field of table 1 the most-significant byte shall be in the lowest-numbered byte position and the least-significant byte shall be in the highest-numbered byte position. However, the last four 1-byte entries contain the most-significant byte of the last four 2-bytes entries, respectively.
11.2.2.1 **Group Number field**
This field shall be a 3-byte field. It shall specify in binary notation the running number of the current Basic Group.

11.2.2.2 **Record Count field**
This field shall be a 4-byte field. It shall specify in binary notation the sum of the values in the Count of Records field in the current Basic Group fields of the GITs of all Basic Groups since LBOT, up to and including the current Basic Group. Separator Marks shall be counted as records.

11.2.2.3 **Separator 1 Count field**
This field shall be a 4-byte field. It shall specify in binary notation the number of Separators 1 written since the LBOT including those in the current Basic Group.

11.2.2.4 **Separator 2 Count field**
This field shall be a 4-byte field. It shall specify in binary notation the number of Separators 2 written since the LBOT including those in the current Basic Group.

11.2.2.5 **Group Number of the Previous Record field**
This field shall be a 3-byte field. It shall specify in binary notation the running number of the highest-numbered previous Basic Group in which a Separator Mark or the beginning of an Unprocessed Record occurred. If no such Basic Group exists, this field shall be set to all ZEROs.

11.2.2.6 **Group Number of the Previous Separator 1 field**
This field shall be a 3-byte field. It shall specify in binary notation the running number of the previous highest-numbered Basic Group which contains the last written Separator 1. If no such Basic Group exists, this field shall be set to all ZEROs.

11.2.2.7 **Group Number of the Previous Separator 2 field**
This field shall be a 3-byte field. It shall specify in binary notation the running number of the previous highest-numbered Basic Group which contains the last written Separator 2. If no such Basic Group exists, this field shall be set to all ZEROs.

11.2.2.8 **Block Access Table Count field**
This field shall be a 3-byte field. It shall specify in binary notation the number of entries in the Block Access Table. This is not the same as the number of Records or Parts of Records in the Basic Group.

11.2.2.9 **Count of Records in the Current Basic Group field**
This field shall be a 3-byte field. It shall specify in binary notation the sum of the following:
- the number of Separator Mark entries in the BAT of the current Basic Group
- the number of Records in the Entities of the current Basic Group
- the sum of the numbers in Bytes No. 6 to No. 8 of the Entity Headers of all Entities for which there is an Entire Entity entry (See 11.2.3.1) in the BAT of the current Basic Group,
- the value which is 1 less than the number in Bytes No. 6 to No. 8 of the Entity Header of the Entity for which there is a Start Part of Entity entry (See 11.2.3.2) in the BAT of the current Basic Group, if such an entry exists,
- the number of Total Count of Entity entries in the BAT of the current Basic Group.

11.2.2.10 **Count of Separators 1 field**
This field shall be a 3-byte field. It shall specify in binary notation the number of Separators 1 written in the current Basic Group.

11.2.2.11 **Count of Separators 2 field**
This field shall be a 3-byte field. It shall specify in binary notation the number of Separators 2 written in the current Basic Group.
11.2.3 Block Access Table (BAT)

The BAT shall contain one or more entries for each Entity and each Separator Mark of the Basic Group. Entities not entirely contained in the Basic Group shall also be identified by one or more entries. The first entry shall be written immediately before the Group Information Table, in byte positions 801 749 to 801 752. Each entry shall be a 4-byte field, structured as shown in figure 30. The 1st byte shall be in the lowest-numbered byte position and the 4th byte shall be in the highest-numbered byte position.

<table>
<thead>
<tr>
<th>Entry of the Block Access Table</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Flag Byte</strong></td>
</tr>
<tr>
<td>1st byte</td>
</tr>
</tbody>
</table>

**Figure 30 - Block Access Table**

Depending on the setting of the Flag Byte, the 3-byte Count field shall express in binary notation a number not greater than $2^{24} - 1$ as specified below. This ECMA Standard specifies the 14 settings of the Flag Byte listed in table 2. Other settings are prohibited by this ECMA Standard.

The most significant bit of the Flag Byte (see table 2), the After Early Warning Point bit, is indicated as indifferent as far as the meaning of the entry is concerned. It shall be set as follows:

- before EWP it shall be set to ZERO;
- after EWP it shall be set to ONE in the current entry and all following BAT entries of the current Basic Group and in all BAT entries of all following Basic Groups.

<table>
<thead>

</tr>
<tr>
<td>1000 0111</td>
</tr>
</tbody>
</table>

11.2.3.1 Entire Entity

This entry relates to an Entity and shall specify that the Entity starts and ends in the current Basic Group. The Count field shall specify the number of bytes in the Entity.
11.2.3.2 **Start Part of Entity**
This entry relates to an Entity and shall specify that the Entity starts in the current Basic Group and ends in a subsequent Basic Group. The Count field shall specify the number of bytes in the Start Part of Entity recorded in the current Basic Group.

11.2.3.3 **Middle Part of Entity**
This entry relates to an Entity and shall specify that the Entity starts in a previous Basic Group and ends in a subsequent Basic Group. The Count field shall specify the number of bytes in the partial Entity which is in the current Basic Group.

11.2.3.4 **Last Part of Entity**
This entry relates to an Entity and shall specify that the Entity starts in a previous Basic Group and ends in the current Basic Group. The Count field shall specify the number of bytes in the partial Entity which is in the current Basic Group. This entry shall be immediately followed in the BAT of the current Basic Group by an entry for Total Count of Entity.

11.2.3.5 **Total Count of Entity**
Total Count of Entity shall follow the Last Part of Entity entry. This entry relates to the same Entity as that of the immediately preceding entry for Last Part of Entity. The Count field shall specify the total number of bytes in the entire Entity.

11.2.3.6 **Separator Mark Entity**
This entry shall specify that the Entity is a Separator Mark record. The Count field shall specify the number 0 if the Entity is a Separator 1 record and the number 1 if the Entity is a Separator 2 record.

11.2.3.7 **Skip**
There shall be a Skip entry as the last entry of the Block Access Table of each Basic Group. This entry indicates that the last byte of user data in the current Basic Group has been reached. The Count field shall specify the remaining number of bytes in the Basic Group. Thus the minimum number that can be specified by the Count field shall be the total number of bytes of the Group Information Table and of the Block Access Table.

The Count Value in the Block Access Table for Skip entries shall be a multiple of 4.

11.2.3.8 **Count fields**
The sum of the numbers specified in the Count fields of those of the types of entry in the following list which are present in the Block Access Table shall be 801 792. The list comprises: Skip, Entire Entity, Start Part of Entity, Middle Part of Entity and Last Part of Entity.

11.2.3.9 **Valid sequences of entries of the Block Access Table**
The valid sequences of entries are specified by table 3, in which states and actions are described within rectangles, and the entries (as designated by the setting of the Flag Byte) are described within ellipses.

Table 3 shows only those entries which are valid as the next entry to be encountered in each state or after each action. All other entries are invalid.
Table 3 - Valid sequences of entries in the Block Access Table

11.3 Sub-Groups

11.3.1 G1 Sub-Group

When a Basic Group has been completed, it shall be split into 18 G1 Sub-Groups, numbered 1 to 18, of 44,544 bytes numbered from 1 to 44,544, starting with the first 44,544 bytes in the first G1 Sub-Group, followed by the next 44,544 bytes in the second G1 Sub-Group, and so on.
11.3.2 **G2 Sub-Group - Randomizing**

The odd numbered bytes of each G1 Sub-Group shall be submitted to an Exclusive OR operation together with a sequence of bits which is the output of the shift register shown in figure 32. The even numbered bytes of each G1 Sub-Group shall be submitted to an Exclusive OR operation together with a sequence of bits which is the output of the shift register shown in figure 32.

**Figure 31 - G1 Sub-Groups**

**Figure 32 - Shift register**

**Figure 33 - G2 Sub-Groups**
For each byte the least significant bit, i.e. bit b1 shall be input first. The logical operators are Exclusive ORs.

The G1 Sub-Group is thereby transformed into two G2 Sub-Groups: the Even G2 Sub-Group and the Odd G2 Sub-Group, each comprising 22 272 bytes.

For \( n = 1, 2, \ldots, 22 272 \), the bytes \( D_n \) of the G1 Sub-Group shall be allocated and numbered as follows:

- the Even G2 Sub-Group comprises bytes \( D_{2n} \)
- the Odd G2 Sub-Group comprises bytes \( D_{(2n-1)} \)

In each G2 Sub-Group, the sequence of the bytes is the same as in the G1 Sub-Group.

### 11.3.3 G3 Sub-Group

The bytes of each G2 Sub-Group shall be placed as follows into a G3 Sub-group. The G3 Sub-group shall be an array of 224 cells each containing 128 bytes. The 22 272 data bytes of each G2 Sub-Group shall be placed in the 192 cells from cell No. 17 to cell No. 208. Each cell shall contain two sets of data bytes of 64 bytes and 52 bytes, respectively, followed by 12 bytes of C1 ECC bytes computed over the 116 data bytes of the cell. The C1 bytes shall be computed as specified in annex G.

Once the 192 cells are all filled as indicated, C2 ECC bytes shall be computed over these 192 cells and the corresponding C2 bytes are entered in cells No. 1 to 16 and cells No. 209 to 224. The C2 bytes shall be computed as specified in annex G.

This operation shall be performed for the Even G2 Sub-Group and for the Odd G2 Sub-Group.

Each 64-byte set contained in each cell constitutes a Block. These Blocks shall be numbered consecutively by Block Numbers in the range 0 to 447.
11.4 Data Block

Each 64-byte of a Block shall be transformed into a 72-byte Data Block by the addition of a Header of 8 bytes preceding the 64 bytes of the block. The structure of the Header shall be as shown in figure 35.
These ID bytes shall contain the following ID Information.

- Data Block Number
- Tape Length and Thickness ID
- Logical Frame ID
- Partition ID
- Area ID
- Position
- Group Count
- Separator 1 Count
- Separator 2 Count
- Record Count
- Absolute Frame Number
- ID Parity

This ID Information shall be recorded as specified in 11.4.2

### 11.4.1 ID information

#### 11.4.1.1 Data Block Number (DBN)

This number is a 9-bit number. It is represented by the 8 bits of byte ID1 and by bit b8 of byte ID2 as the msb of this number. The value of this number shall be in the range 0 to 477.

#### 11.4.1.2 Tape Length and Thickness ID

This 8-bit field shall be set as follows.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>8, 7</td>
<td>to indicate a tape thickness</td>
</tr>
<tr>
<td>00</td>
<td>of 6.5 μm to 7.3 μm</td>
</tr>
<tr>
<td>01</td>
<td>of 5.0 μm to 5.5 μm</td>
</tr>
</tbody>
</table>

Bits 6 to 1 shall express in binary notation an integer \( n \) in the range 1 to 46, such that \( 5n \) indicates the length of the tape in metres.

#### 11.4.1.3 Logical Frame ID (LFID)

This 8-bit field shall be as follows.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>This bit shall be set to ONE,</td>
</tr>
<tr>
<td></td>
<td>if the Frame is the last</td>
</tr>
<tr>
<td></td>
<td>of the Basic Group, else it</td>
</tr>
<tr>
<td></td>
<td>shall be set to ZERO.</td>
</tr>
<tr>
<td>7</td>
<td>This bit shall be set to ONE,</td>
</tr>
<tr>
<td></td>
<td>if the Frame is an ECC 3</td>
</tr>
<tr>
<td></td>
<td>Frame (See 16.5.3), else it</td>
</tr>
<tr>
<td></td>
<td>shall be set to ZERO.</td>
</tr>
<tr>
<td>6-1</td>
<td>These bits shall be set to all</td>
</tr>
<tr>
<td></td>
<td>ZEROs, if the Frame is an</td>
</tr>
<tr>
<td></td>
<td>Amble Frame, else they shall</td>
</tr>
<tr>
<td></td>
<td>express in binary notation the</td>
</tr>
<tr>
<td></td>
<td>ordinal number ( n ) of the</td>
</tr>
<tr>
<td></td>
<td>Data Frame, for ( n=1 ) to 20</td>
</tr>
</tbody>
</table>

<td>ID Parity</td>
</tr>
</tbody>
</table>
11.4.1.4 Partition ID
This 8-bit field shall specify in binary notation the ordinal number of the partition in the range 0 to 255.

11.4.1.5 Area ID
This 4-bit field shall specify the current area on the tape and thereby indicate the type of the current Frame. Other settings than those specified in figure 36 are prohibited by this ECMA Standard.

<table>
<thead>
<tr>

<tr>
<td>0 1 1 1</td>
<td>Optional Device Area</td>
</tr>
</tbody>
</table>

Figure 36 - Area ID

11.4.1.6 Repeat
This 3-bit field shall specify the number of instances of a Basic Group.

- 000 shall indicate that there is only one instance of the Basic Group.
- 001 shall indicate that there are 2 instances of the Basic Group.
- 010 shall indicate that there are 3 instances of the Basic Group.
- 011 shall indicate that there are 4 instances of the Basic Group.
- 100 shall indicate that there are 5 instances of the Basic Group.
- 101 shall indicate that there are 6 instances of the Basic Group.
- 110 shall indicate that there are 7 instances of the Basic Group.
- 111 shall indicate that there are 8 instances of the Basic Group.

11.4.1.7 Position
This 3-bit field shall specify the ordinal position of the current recorded instance of this Basic Group in a sequence of contiguous recorded instances of this Basic Group.

<table>
<thead>
<tr>
<th>Bit Positions</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 2 1</td>
<td></td>
</tr>
<tr>
<td>0 0 0</td>
<td>The first instance of the Basic Group.</td>
</tr>
<tr>
<td>0 0 1</td>
<td>The 2nd instance of the Basic Group.</td>
</tr>
<tr>
<td>0 1 0</td>
<td>The 3rd instance of the Basic Group.</td>
</tr>
<tr>
<td>0 1 1</td>
<td>The 4th instance of the Basic Group.</td>
</tr>
<tr>
<td>1 0 0</td>
<td>The 5th instance of the Basic Group.</td>
</tr>
<tr>
<td>1 0 1</td>
<td>The 6th instance of the Basic Group.</td>
</tr>
<tr>
<td>1 1 0</td>
<td>The 7th instance of the Basic Group.</td>
</tr>
<tr>
<td>1 1 1</td>
<td>The 8th instance of the Basic Group.</td>
</tr>
</tbody>
</table>

Figure 37 - Position field

11.4.1.8 Group Count
This 24-bit field shall specify the number of Basic Groups that have been written following the Vendor Group of the current partition, starting with 1 and including the current Basic Group. The Vendor Group shall have a Basic Group count of 0. When Repeat is employed, the Group Count shall remain constant for each instance of a Basic Group.
11.4.1.9 **Separator 1 Count**
This 32-bit field shall specify the number of Separators 1 written since the beginning of the partition up to and including the current Basic Group. The first Separator 1 in the partition shall have a count of 1.

11.4.1.10 **Separator 2 Count**
This 32-bit field shall specify the number of Separators 2 that have been written since the beginning of the partition, up to and including the current Basic Group. The first Separator 2 in the partition shall have a count of 1.

11.4.1.11 **Record Count**
This 32-bit field shall specify the number of Records written since the beginning of the partition, including any complete Records in the current Basic Group. This number shall specify the Record Count (See 11.2.2) recorded in the Group Information Table.

11.4.1.12 **Absolute Frame Number (AFN)**
This 24-bit field shall specify the Absolute Frame Number of the current Frame. The first Frame of the Reference Area shall have AFN 1 Any discontinuous or repeated numbers shall only occur in an Amble Frame sequence (see 17.1), except in Intermediate Frames (see 16.5.5).

11.4.1.13 **ID Parity**
The ID Parity bytes shall be computed using an extended Reed-Solomon Code.
Calculation in a GF (2^8) shall be defined by:
\[ G(x) = x^8 + x^4 + x^3 + x^2 + 1 \]
A primitive element \( \alpha \) in GF (2^8) is 00000010
The ID parity bytes shall satisfy:
\[ Hs \times Vs = 0 \]

\[
Hs = \begin{bmatrix}
1 & 1 & 1 & 1 & 1 & 1 & 0 \\
\alpha & \alpha^4 & \alpha^3 & \alpha^2 & \alpha^1 & 1 & 0 & 1
\end{bmatrix}
\]

\[
Vs = \begin{bmatrix}
ID1 \\
ID2 \\
ID3 \\
ID4 \\
ID5 \\
ID6 \\
ID7 \\
ID8
\end{bmatrix}
\]

11.4.2 **Recording of the ID Information in the Data Block Headers**
The 448 Data Blocks of each G3 Sub-Group shall be arranged in 28 sequences of 16 Data Blocks. The ID Information shall be laid out within these 16 Data Blocks as specified in figure 38. The same layout is repeated in each sequence of 16 Data Blocks.

Figure 38 - Allocation of ID Information (continued)
### 12 Method of recording

The method of recording shall be

- a ONE is represented by a flux transition at the centre of a bit cell;
- a ZERO is represented by the absence of a flux transition in the bit cell.

#### 12.1 Physical recording density

The nominal maximum physical recording density is 5 714,3 ftpmm. The resulting nominal bit cell length is 0,175 µm. These values are derived from the track length (see 13.7) divided by the number of bits per track.

#### 12.2 Long-term average bit cell length

The long-term average bit cell length for each track shall be measured over 64 Recorded Data Blocks. It shall be within 0,2 % of the nominal bit cell length.

</table>
12.3 Short-term average bit cell length
The short-term average bit cell length, referred to a particular bit cell, shall be the average of the preceding
40 bit cells. It shall be within 0.35% of the long-term average bit cell length for the preceding track of the
same azimuth.

12.4 Rate of change
The above defined short-term average bit cell length shall not change at a rate greater than 0.05% per bit
cell.

12.5 Bit shift
When measured according to annex E (|A_{1110}| + |A_{0111}|)/(A_{0100} + A_{0010}) shall be less than 0.05.

12.6 Read signal amplitude
The Average Signal Amplitude of an interchanged cartridge shall be
– at 1 142.9 ftpmm, 1 428.6 ftpmm, 1 904.8 ftpmm, 2 857.1 ftpmm and 3 809.5 ftpmm: between 80% and
140% of the respective nominal recorded levels (see C.1).

12.7 Maximum recorded levels
Recorded signals shall be erasable by overwriting. The Maximum Allowable Recorded Levels specified in
C.2 of annex C shall not be exceeded.

13 Track geometry
13.1 Track configuration
The helical track pattern is formed by the relationship between the direction of tape motion and the axis of
rotation of a pair of heads, one of which has a positive azimuth angle and the other a negative azimuth
angle. The direction of recording is away from the Tape Reference Edge. The track configuration is shown
in figure 39.

\[ A \quad : \quad \text{Tape width} \quad L \quad : \quad \text{Track length} \]
B : Ideal tape centreline
θ : Track angle
P : Track pitch
T : Track width

Figure 39 - Track configuration (view on the recording surface)

13.2 Average track pitch
The average track pitch, taken over any group of 30 consecutive tracks, shall be 11,00 µm ± 0,20 µm. The track pitch at a non-seamless append point (see 16.5.6.2) shall not be included in this average.

13.3 Variations of the track pitch
The change of track pitch between successive track pitches shall not exceed 2,0 %, excluding the effect of an appending operation (see 16.5.6).

13.4 Track width
The nominal track width is 11,00 µm.
The measured track width shall be 11,00 µm ± 1,50 µm.
This requirement shall not apply at a non-seamless append point.

13.5 Track angle
The nominal angle of each track with respect to the Tape Reference Edge shall be 4,895 0°.

13.6 Track edge straightness
The leading edge of each track shall be straight when measured according to annex F.

13.7 Track length
The length of each track shall be 60,170 mm ± 0,050 mm.

13.8 Azimuth angles
The positive azimuth angle shall be 25°0'0" ± 0°15'0"
The negative azimuth angle shall be -25°0'0" ± 0°15'0".

14 Recorded patterns
Each 8-bit byte of the Main Data Blocks shall be represented on the tape by a 10-bit pattern. Annex D specifies for each 8-bit byte the 10-bit pattern to be recorded. The bits of the 10-bit pattern are called Channel bits.

14.1 Recorded Data Block
A Recorded Data Block shall consist of 730 Channel bits representing the 72 8-bit bytes of a Main Data Block preceded by a Sync field of 10 Channel bits with one of the following patterns:
   a) 0100010001
   b) 1100010001
Pattern a) shall be used for Q' = -1, DC = 0, Q = 1; pattern b) for Q' = 1, DC = 0, Q = 1 (see annex D). Either pattern may be used when there is no preceding pattern, and hence no value of Q'. See annex D for the order of recording.

In a track of positive azimuth, the Recorded Data Blocks shall represent the Main Data Blocks formed from the Even G3 Sub-Group. In the track of negative azimuth of the same Frame, the Recorded Data Blocks shall represent the Main Data Blocks formed from the corresponding Odd G3 Sub-Group. Within each track, the Recorded Data Blocks shall be recorded in the sequence of their Block Numbers.

14.2 Margin blocks
These blocks shall have a length of 730 Channel bits consisting of the repeated Channel bit pattern 1100 1100 ... or 0011 0011
15 Format of a track

15.1 Track structure

Each track shall consist of two Margin Zones, three ATF Zones and two Main Data Zones which are shown in tables 4 and 5. ATF Zones consist of spacer Blocks and ATF Blocks which are different between a positive azimuth track and a negative azimuth track.

Table 4: Format of a track (Negative azimuth track)

</tr>
</tbody>
</table>

There are 471 Blocks in each track.
15.2 **Positioning accuracy**

The centre of the 236th Block of a track shall be at a distance of 4,460 mm ± 0,021 mm from the Tape Reference Edge. The centre of the 236th Block on the centre line of the track is the midpoint between the first bit of the 234th Block and that of the 239th block. In addition the centres of the 236th Blocks of any pair of adjacent tracks shall not differ by more than 5,4 μm. This is equivalent to 0,5 Block along the track at the centre of the track.

15.3 **Tracking scheme**

Tracking shall be achieved by the Automatic Track Finding (ATF) method. ATF blocks shall be allocated to three zones of a track: ATF Zone 1, ATF Zone 2 and ATF Zone 3 as shown in tables 4 and 5.

Each ATF Zone shall comprise Spacer Blocks and ATF Blocks.

Spacer Blocks shall have a length of 730 Channel bits consisting of the repeated Channel bit pattern 1010101010. Spacer Blocks shall be recorded with a positive azimuth on positive azimuth tracks, and with a negative azimuth on negative azimuth tracks.

ATF Blocks shall have a length of 730 Channel bits consisting of the repeated Channel bit pattern 1000010000. ATF Blocks shall be recorded with a positive azimuth.

ATF Blocks are designated as ATF-A, ATF-B and ATF-C for the purpose of illustrating the phase relationships among tracks in figure 40. ATF-B Blocks on track \( n \), ATF-C blocks on track \( n-1 \) and ATF-A Blocks on track \( n-2 \) shall be recorded in phase.

![Figure 40 - Allocation of ATF and Spacer Blocks](image)

16 **Layout of the tape**

The layout of the tape shall consist of a Device Area followed by up to 256 partitions. Each partition shall consist of

- the Reference Area
- the System Area
- the Data Area
- the EOD Area
- the Optional Device Area
16.1 **Device Area**

This area shall be the first area on the magnetic tape and shall extend from PBOT to LBOT. It shall not be used for writing data for interchange. Its length, measured parallel to the Tape Reference Edge, from PBOT to the first bit of the first block of the first recorded track of the Reference Area, shall be 870 mm ± 10 mm. It shall consist of three zones: a spin-up zone, a test zone and a guard zone.

The first zone of the Device Area is a spin-up zone. It is the part of the tape which is wrapped around the drum when the tape is loaded into the drive.

The spin-up zone shall be followed by a test zone available for read/write purposes. The contents of these two zones are not specified by this ECMA Standard.

The test zone shall be followed by a guard zone of length 6.2 mm min. in which no recording is permitted.
16.2 **Reference Area**
This area shall consist of the Frames with AFN 1 to AFN 264, of which the first starts at LBOT and has AFN 1. The Reference Area is used as the physical reference when updating the System Log. The content of these Frames is not specified by this ECMA Standard and shall be ignored in interchange.

16.3 **Position Tolerance Band No. 1**
This band shall have a nominal length equivalent to 24 Frames, from AFN 265 to AFN 288. It is used to accommodate the positioning tolerances when updating the System Log. Discontinuities and repetitions of the AFNs may occur in this band. The recorded signals may be ill-defined in this band. The content of these Frames is not specified by this ECMA Standard and shall be ignored in interchange.

16.4 **System Area**
This area shall consist of the System Preamble, System Log, System Postamble, Position Tolerance Band No. 2, and the Vendor Group Preamble.

16.4.1 **System Preamble**
The System Preamble shall consist of 72 System Amble Frames with AFN 289 to AFN 360. Their content is not specified by this ECMA Standard and shall be ignored in interchange.

16.4.2 **System Log**
The System Log shall be recorded in the MIC, it may be recorded also on the tape, see 16.4.2.2.2 and clause 18.

If the System Log is recorded also on the tape, there shall be 180 instances with AFN 361 to AFN 540 of the Frame shown in figure 42 recorded on the tape. In each partition 48 bytes shall be allocated to the Partition Information of the partition. The Partition Information of each partition shall be recorded in the System Log of Partition 0. Figure 42 shows the System Log and Vendor Data information.

If the System Log is recorded in the MIC only, the content of these 180 Frames is not specified by this ECMA Standard and shall be ignored in interchange. Clause 18 specifies how the System Log is recorded in the MIC.

Figure 43 - Partition Information

Where the field of a Partition Information contain numerical values, these are recorded in binary notation in these fields.

16.4.2.1.1 Previous Groups Written

This field shall specify the number of Basic Groups physically written to the partition since the last update of the System Area.

16.4.2.1.2 Total Groups Written

This field shall specify the total number of Basic Groups physically written to the partition since the first time the partition was written.

16.4.2.1.3 Previous Groups Read

This field shall specify the number of Basic Groups physically read from the partition since the last update of the System Area.

16.4.2.1.4 Total Groups Read

This field shall specify the total number of Basic Groups physically read from the tape partition since the first time the partition was written. This number shall not include any read operation which is part of a Read-After-Write check. The number accumulates over the life of the tape unless a format pass is performed, in which case this field is re-set to the value 0.
16.4.2.1.5 **Total Rewritten Frames**
This field shall be the total number of Frames of the partition that have been rewritten since the partition was first written. It shall be incremented by 1 each time a Frame is repeated following error detection by the Read-After-Write process. This count shall not include any Frames which are written between the original Frame and its rewrite. The number accumulates over the life of the tape unless a format pass is performed, in which case this field is re-set to the value 0.

16.4.2.1.6 **Total 3rd ECC Count**
This field shall specify the number of Basic Groups which have been physically read and data has not been recovered without requiring the use of C3 correction since the first time the partition was written. The number accumulates over the life of the tape unless a format pass is performed, in which case this field is re-set to the value 0.

16.4.2.1.7 **Access Count**
If used, this field shall specify the number of accesses to the partition. This field shall be set to all ZEROs if not used.

16.4.2.1.8 **Update Replace Count**
If used, this field shall specify the number of write operations to the partition. This field shall be set to all ZEROs if not used.

16.4.2.1.9 **Previous Rewritten Frames**
This field shall specify the number of Frames of the partition that have been rewritten since the last update of the System area. It shall be incremented by 1 each time a Frame is repeated following error detection by the Read-After-Write process. This count shall not include any Frames which are written between the original Frame and its rewrite.

16.4.2.1.10 **Previous 3rd ECC Count**
This field shall specify the number of Basic Groups which have been physically read and data has not been recovered without requiring the use of C3 correction since the last update of the System area.

16.4.2.1.11 **Load Count**
This field shall specify the number of times the tape has been loaded since the first time the tape was written. One load shall consist of threading the tape around the drum of the drive mechanism, positioning the tape ready for use and later unthreading the tape. The number accumulates over the life of the tape unless a format pass is performed, in which case this field is re-set to the value 0. This field shall be Reserved in the System Log of Partition 0 of a partitioned tape.

16.4.2.1.12 **Last Valid Absolute Frame Number**
This field shall specify the AFN of the last Frame containing valid data. The first Frame of the Reference Area shall have AFN 1.

16.4.2.1.13 **Flag Byte**
Bit 1 Prevent Write
If set to ZERO, write operation for the partition is enabled
If set to ONE, write operation for the partition is inhibited

Bit 2 Prevent Read
If set to ZERO, read operation for the partition is enabled
If set to ONE, read operation for the partition is inhibited.

Bit 3 Prevent Write Retry
If set to ZERO, write-retry operation for the partition is enabled
If set to ONE, write-retry operation for the partition is inhibited
Bit 4  Prevent Read Retry
If set to ZERO, read-retry operation for the partition is enabled
If set to ONE, read-retry operation for the partition is inhibited

Bits 5 to 7 shall be set to ZERO.

Bit 8  Partition is Opened
Shall be set to ZERO, when all operations in the partition have been performed
Shall be set to ONE before a read and/or a write operation within the partition

16.4.2.1.14 Maximum Absolute Frame Number
This field shall specify the AFN of the last Frame of the last EOD Area.

16.4.2.1.15 Reserved Field
Reserved Fields shall be set to all ZEROS.

16.4.2.2 Volume Information
This 72-byte field shall contain the information about the volume.

</table>

Figure 44 - Volume Information

16.4.2.2.1 Length and Thickness Numbers
Bit 6 to bit 1 shall be set to the same value as that recorded by Bit 6 to Bit 1 of the Tape Length and Thickness ID byte (See 11.4.1.2).

Bit 8 and bit 7 when set to
00 Indicate Type A
01 Indicate Type B

Other settings of these bits are prohibited by this ECMA Standard.

16.4.2.2.2 Flags
Bit 1 If set to ZERO, the number of partitions shall be 2
If set to ONE, the maximum number of partitions is limited by the size of the MIC.
Bit 2 If set to ZERO, and there is an Optional Device Area, then load/unload shall be done at the Optional device Area. If set to ONE, load/unload shall be done at the PBTO.

Bit 3 and bit 4 These bits shall indicate the location of the System Log. If set to 10, the System Log is recorded both on the tape and in the MIC. If set to 11, the System Log is recorded in the MIC only.

Bit 5 shall be set to ONE to indicate the presence of MIC.

Bit 6 to bit 8 shall be set to all ZEROs.

Other settings of these bits are prohibited by this ECMA Standard.

16.4.2.2.3 Last Partition Number
This is the last valid partition number on the tape.

16.4.2.2.4 Device Area Map
This is a bit allocation map of the Optional Device Area. There are 256 bits in the 32 bytes. A bit is assigned to each partition. If this bit is set to ONE then the partition contains an Optional Device Area.

16.4.2.3 System Log Vendor Data Type Number
This number shall be represented by two bytes.

When set to the value 0, the System Log Vendor Data shall be all ZEROs.
When set to the value 1, the System Log Vendor Data shall contain vendor-unique information.

Other values of this number are prohibited by this ECMA Standard.

16.4.3 System Postamble
The System Postamble shall consist of 24 System Amble Frames AFN 541 to AFN 564. Their content is not specified by this ECMA Standard and shall be ignored in interchange.

*Note*
*It is recommended that the continuum comprising the System Preamble, the System Log, the Vendor Data information and the System Postamble be written in a continuous motion when the System Log is updated.*

16.4.4 Position Tolerance Band No. 2
This band shall have a nominal length equivalent to 24 Frames. The content of these Frames is not specified by this ECMA Standard and shall be ignored in interchange.

16.4.5 Vendor Group Preamble
The Vendor Group Preamble shall consist of 72 Frames with AFN 589 to AFN 660. The Vendor Group Preamble shall immediately precede the Vendor Group and be contiguous with it. The content of these Frames is not specified by this ECMA Standard and shall be ignored in interchange.

16.5 Data Area
This area shall consist of the Vendor Group and one or more Recorded Data Groups.

16.5.1 Vendor Group
A Vendor Group is the recorded instance of Basic Group No. 0, the content of which is not specified by this ECMA Standard. The Vendor Group is formed from the bytes of that Basic Group by applying the operations described in clause 11 and recording the resulting Frames. The first of these Frames shall have AFN 661.

In addition none or either or both of two further operations, namely ECC3 and Repeated Frames may be applied.
No unrecorded space or physical discontinuity or seam or AFN discontinuity or repetition may occur within a Vendor Group.

16.5.2 Recorded Data Group

Each Recorded Data Group is a recorded instance of a Basic Group, and is formed from the data sent from a host computer by applying the operations described in clause 11 and recording the resulting Frames in the sequence of their Logical Frame Numbers.

In addition, none or either or both of two further operations may be applied. These are ECC3 and Repeated Frames. No unrecorded space or physical discontinuity or seam or, AFN discontinuity or repetition may occur within a Recorded Data Group.

16.5.3 ECC3

The Error Correction Code 3 has the capability of correcting any two tracks which are bad in a Recorded Data Group. The ECC3 data is derived from the 18 G1 Sub-Groups of the Basic Group to form a 19th and a 20th G1 Sub-Group. It uses the following Reed-Solomon code:

$$\text{GF}(2^8) (20, 18, 3)$$

The calculation on $\text{GF}(2^8)$ shall be defined by the following polynomial:

$$G(x) = x^8 + x^4 + x^3 + x^2 + 1 \quad \alpha = (00000010)$$

The interleave depth of ECC3 shall be one frame, the ECC bytes shall satisfy

$$H_R \times V_R = 0$$

The generator polynomial shall be

$$G_R (x) = \prod_{i=0}^{j=1} (x - \alpha^i)$$

$$H_R = \begin{bmatrix} 1 & 1 & 1 & 1 & \ldots & 1 & 1 & 1 \\ \alpha^{19} & \alpha^{18} & \alpha^{17} & \alpha^{16} & \ldots & \alpha^2 & \alpha & 0 \end{bmatrix}$$
16.5.4 Multiple Recorded Instances

Each Basic Group, other than Basic Group No. 0, may be recorded in a sequence of contiguous instances. The maximum number of such instances shall be 8. Within a sequence of Recorded Data Groups which are derived from the same Basic Group the values of Logical Frame ID, Position and AFN will be different. There will also be differences in the values of the Parity bytes computed from these. There may also be differences in the number of Repeated Frames per Recorded Data Group in such a sequence.

16.5.5 Repeated Frames

In the Data Area, a Frame within a Recorded Data Group may be repeated by rewriting it further along the tape. The repeated Frame may be written after zero, one, two, three, four, five, six or seven other Frames have been written. Each such sequence (i.e. the original or repeated Frame and the zero, one, two, three, four, five, six or seven following Frames) can be repeated multiple times, e.g. to allow skipping over bad areas on the tape. The maximum number of instances of a sequence shall be 256, i.e. the original and up to 255 repetitions.
Intermediate Frames, i.e. those Frames written between the original Frame and its next occurrence shall
start with the Frame the Logical Frame Number of which is the next in the normal sequence, and shall
follow the correct sequence thereafter. The correct sequence requires successive Frames to have Logical
Frame Numbers which increment by one until the last Frame in the Recorded Data Group, or the ECC3
Frames if present, after which they restart from 0 (for an Amble Frame) or one (for the first Frame of the
next Recorded Data Group). Amble Frames are allowed in this sequence, provided the limit of seven
Intermediate Frames is not exceeded. The final occurrence of the repeated Frame shall be followed by
the Intermediate Frames written in the correct sequence. Discontinuities or repeated AFNs shall not
occur.

16.5.6 Appending and overwriting

When new data is appended to data already recorded on tape, or existing data is overwritten by new data,
the point at which recording may start shall be referenced to the last Frame (Frame A in figure 46) of a
Recorded Data Group. If Multiple Recorded Instances of the last group exist, the relevant Recorded Data
Group is the last in the sequence. If Repeated Frames have been recorded, the relevant Frame is the last
repetition of the last Frame. The smallest unit of appending or overwriting is a Recorded Data Group.

Note

After overwriting commences, all data between the current recording point and PEOT is logically
inaccessible.

The rules for appending and overwriting are identical. For simplicity, the following description refers
only to appending.

Data may be appended to the tape by either the seamless or non-seamless methods. An appending
operation may be described as seamless only if the appended tracks are placed so as to form a
continuous sequence with the previous tracks. No track shall be partially overwritten to the point of
being unreadable nor shall any gaps be left between tracks.

1 Frame
m Amble Frames

AFN ———— n n + 2 n + 3 + m

Figure 45 - Appending rules

The Frames up to, and including, Frame A on figure 45 contain information which is to be retained. The
append starts with Amble Frames at Frame B and the information at Frame C.

16.5.6.1 Seamless appending rules

Rule 1. There shall be one Frame between Frame A and Frame B, i.e. if Frame A has AFN n, then
Frame B shall have AFN n+2.

Rule 2. The Frame written between Frames A and B shall be contiguous with Frame A, i.e. no
unrecorded space between A and B is permitted, nor is any discontinuity or repetition of AFNs, nor is
any physical discontinuity. The Group Number of this Frame shall be greater than that of Frame A,
unless this Frame is an Amble Frame, in which case its Group Number shall be equal to that of Frame
A. The content of this Frame shall be ignored.
Rule 3. There shall be a minimum of one Amble Frame between Frames B and C, i.e. if Frame B has AFN \( n+2 \), then Frame C shall have AFN \( n+4 \) minimum. No unrecorded space, physical discontinuity, or AFN discontinuity or repetition is allowed between Frames B and C.

Rule 4. The position of the first track of Frame B (AFN \( n+2 \)), as measured along the length of the tape at the point shown in figure 46, shall be at a distance of \( x = 257.8 \mu m \pm 42.9 \mu m \) from the first track of the Frame with AFN \( n+1 \).

![Figure 46 - Tolerance on seamless appending](image)

16.5.6.2 Non-seamless appending rules

Rule 1. The distance between Frame A and Frame B shall be sufficient for a minimum of 1 and a maximum of 11 Frames. No unrecorded space shall be permitted between Frame A and Frame B. One or more Frames between Frame A and Frame B may be ill-defined, e.g., as a result of partial overwriting at an append point.

Rule 2. Discontinuities and repetitions of AFN are permitted between Frame A and Frame B, provided that, where Frame A has AFN \( n \),

- all Frames have an AFN greater than \( n \), and
- Frame B has AFN \( n+2 \) min. and AFN \( n+12 \) max.

Rule 3. Amble Frames between Frame A and Frame B shall have a value of Group Number which is equal to that of Frame A. Other Frames between Frame A and Frame B shall have a value of Group Number which is greater than that of Frame A.

Rule 4. There shall be a minimum of 29 Frames between Frames B and C, i.e. if Frame B has AFN \( n' \), where \( n+2 \leq n' \leq n+12 \), then Frame C shall have AFN \( n'+30 \) minimum. No unrecorded space, physical discontinuity or seam or AFN discontinuity or repetition shall be allowed between Frames B and C.

16.6 EOD Area

The Data Area shall be followed by an EOD Area.

In all partitions, if the length of tape between the last Amble Frame and LEOT is greater than, or equal to, 300 Frames, the EOD Area shall consist of at least 300 Frames. If the length of tape between the last Amble Frame and LEOT is less than 300 Frames, the length of the EOD Area shall be equal to that length.
In the last partition, the EOD Area shall consist of a minimum of 300 Amble Frames, and shall start after the last Amble Frame in the sequence of Amble Frames which follows the last Recorded Data Group. The first Frame of the EOD Area shall be recorded at least 5 000 mm before PEOT.

More than one EOD Area may exist on the tape. More than one EOD Area may exist on a Partition. The EOD Area closest to LBOT in a partition shall be the only one valid for information interchange.

16.7 Optional Device Area
The EOD Area may be followed by an Optional Device Area which extends up to the Partition Boundary or PEOT. The contents of this Optional Device Area are not defined for interchange.

16.8 Logical End Of Tape (LEOT)
The LEOT shall be a point at a distance of 300 Frames before the Partition Boundary.

16.9 Logical Beginning of Tape (LBOT)
The LBOT is the Partition Boundary. The first Frame after this point shall have the AFN 1

16.10 Early Warning Point - EWP
For a new or bulk-erased tape the position of the EWP is calculated by the drive writing the tape. The calculation shall ensure that the EWP is not less than 5 258 mm before PEOT. Until data is recorded beyond the calculated EWP no indication of its position is recorded on the tape. When data is first recorded beyond the calculated EWP, the setting of the AEWP bit changes from ZERO to ONE in the last Basic Group which is completely or partially recorded before that point. This changeover then denotes the position of the EWP when the tape is subsequently read.

For the last partition containing data which is being overwritten or appended, if the point at which overwriting commenced is before the EWP as defined prior to the commencement of overwriting, a new position of the EWP shall be calculated by the drive currently writing the tape. The calculation shall ensure that the EWP is not less than 5 258 mm before PEOT. When data is recorded beyond this calculated EWP, the setting of the AEWP bit changes from ZERO to ONE in the last Basic Group which is completely or partially recorded before that point. This changeover then denotes the position of the EWP when the tape is subsequently read.

For the last partition containing data which is being overwritten or appended, if the AEWP bit changes from ZERO to ONE prior to the point at which overwriting commenced, the position of the EWP shall be denoted by that changeover, i.e. the AEWP bit shall be set to ONE in all overwriting groups.

Within an empty partition the position of the EWP is calculated by the drive writing the tape. The calculation shall ensure that the EWP is not less than 1 000 Frames before the LEOT. Until data is recorded beyond the calculated EWP, no indication of its position is recorded on the tape. When data is first recorded beyond the calculated EWP, the setting of the AEWP bit changes from ZERO to ONE in the Basic Group which is completely or partly recorded before that point. This changeover then denotes the position of the EWP when the tape is subsequently read.

For partitions, except for the last partition, containing data which is being overwritten, if the point at which overwriting commenced is before the EWP defined before the commencement of overwriting, a new position of the EWP shall be calculated by the drive currently writing the tape. The calculation shall ensure that this calculated EWP is not less than 1 000 Frames before the LEOT. When data is recorded beyond this calculated EWP, the setting of the AEWP bit changes from ZERO to ONE in the Basic Group which is completely or partly recorded before that point. This changeover then denotes the position of the EWP when the tape is subsequently read.

For partitions, except the last one, containing data which is being overwritten, if the AEWP bit changes from ZERO to ONE prior to the point at which overwriting commenced, the position of the EWP is denoted by that changeover, i.e. the AEWP bit is set to ONE in all overwritten Basic Groups in this partition.

16.11 Empty Partition
An empty partition shall contain:

- a Reference Area
- a System Area
- a Data Area comprising a Vendor Group and at least 12 Amble Frames
- a minimum of 300 Frames identical with those of the EOD Area of a partition

The Vendor Group Preamble, the Data Area and the following Amble Frames shall form a continuum which shall extend to the Partition Boundary or PEOT and in which no unrecorded space, physical discontinuity or seam or AFN discontinuity or repetition shall occur.

16.12 Initialization

Initialization is a procedure which shall be carried out before the first use of a tape cartridge for recording user data (it may be also used at other times). The procedure ensures that there shall be no unrecorded space between LBOT and the end of the Vendor Group. The extent from LBOT to the end of the Vendor Group shall be written as a continuum in which the Position Tolerance Bands No. 1 and No. 2 shall have each a nominal number of Frames of 24. The Frames in the Position Tolerance Band No. 1 shall have their Area ID set to the Reference Area ID.

If an initialization is performed on a recorded tape, it will destroy all data thereon, including the history data in the Volume Information and Partition Information.

*Note*

The tape layout is such that a separate initialization on a new or bulk-erased tape is not necessary prior to the recording of the first Recorded Data Group. The Reference Area, System Area and Vendor Group can be recorded at a time immediately prior to the recording of the first Recorded Data Group.

17 Housekeeping Frames

Housekeeping Frames shall not contain any user data or separators. Data shall be recorded only in the ID Information (see 11.4.1), this data being dependent on the area of the magnetic tape where the Housekeeping Frame is recorded. The content of Housekeeping Frames is not specified by this ECMA Standard.

There are two types of Housekeeping Frames, namely Amble Frames and System Amble Frames.

17.1 Amble Frames

Amble Frames shall be permitted only in the Data Area. Their Logical Frame Number shall be 0.

Amble Frames shall not be permitted within a Recorded Data Group, except within a run of Intermediate Frames, and are not permitted before the Vendor Group.

An Amble Frame shall be preceded either by another Amble Frame or by the last Frame of a Recorded Data Group, except at an append point.

The content of these Frames is not specified by this ECMA Standard and shall be ignored in interchange.

17.2 System Amble Frames

System Amble Frames shall be recorded within the System Area; their Absolute Frame Numbers in the range 289 to 360 and 541 to 564.

The content of these Frames is not specified by this ECMA Standard and shall be ignored in interchange.
18 Content of the MIC

This clause specifies the content of the MIC. The maximum number of Partitions on the tape depends on the capacity of the MIC. Figure 47 specifies the content of the MIC when 12 Partitions are defined. The fields of the Volume Information are specified in 16.4.2.2. The fields of the Partition Information are specified in 16.4.2.1.

The contents of the shaded fields are not specified by this ECMA Standard and shall be ignored in interchange.

Figure 47 - Content of the MIC in the case of 12 Partitions
Annex A  
(normative)

Measurement of light transmittance

A.1 Introduction
The following description outlines the general principle of the measuring equipment and measuring method to be applied when measuring the light transmittance of tape.

For the purpose of this ECMA Standard "light transmittance" is defined by convention as the relationship between the reading obtained from the measuring equipment with the test piece inserted and the reading obtained when no test piece is present. The transmittance value is expressed as the percentage ratio of the two readings.

A.2 Description of the measuring equipment
The equipment shall consist of
  − the radiation source;
  − the radiation receiver;
  − the measuring mask;
  − the optical path;
  − the measuring circuitry.

A.2.1 Radiation source
An infra-red light-emitting diode (LED) with the following parameters shall be used:
  wavelength at peak emission : 850 nm ± 50 nm
  half-power bandwidth : ± 50 nm

A.2.2 Radiation receiver
A flat silicon photo diode shall be used. It shall be operated in the short circuit mode.

A.2.3 Measuring mask
The measuring mask shall have a thickness of 2 mm and a circular aperture of diameter $d$ such that the area is 80 % to 100 % of the active area of the photo diode.

The surface of the mask shall be matt black.

The test piece shall be held firmly against the mask to cover the aperture and to ensure that no ambient light leaks past.

A.2.4 Optical path (figure A.1)
The optical path shall be perpendicular to the mask. The distance from the emitting surface of the LED to the mask shall be

$$L = \frac{d}{2 \tan \alpha} \text{ mm}$$

where $d$ is in mm and $\alpha$ is the angle where the relative intensity of the LED is equal to, or greater than, 95% of the maximum intensity of the optical axis.

A.2.5 Finish
The whole assembly shall be enclosed in a matt black case.
A.2.6 Measuring circuitry (figure A.2)

The components of the measuring circuitry are

- **E**: regulated power supply with variable output voltage
- **R**: current-limiting resistor
- **LED**: light-emitting diode
- **Di**: silicon photo diode
- **A**: operational amplifier
- **R_{f0}, R_{f1}**: feedback resistors
- **S**: gain switch
- **V**: voltmeter

The forward current of the LED, and consequently its radiation power, can be varied by means of the power supply E.

Di is operating in the short circuit mode.

The output voltage of the operational amplifier is given by

\[ V_0 = I_k \times R_f \]

where:

- \( I_k \) is the short-circuit current of Di.

The output voltage is therefore a linear function of the light intensity.

\( R_{f0} \) and \( R_{f1} \) shall be low temperature-drift resistors with an accuracy of 1%. The following ratio applies

\[ \frac{R_{f0}}{R_{f1}} = \frac{1}{20} \]

A.3 Measuring method

- Set switch S to position 0.
- With no test piece mounted vary the supply voltage of E until voltmeter V reads full scale (100 %).
- Mount a leader or trailer tape on the mask. The reading of the voltmeter shall be in the range 60 % to 100 %.
- Mount a test piece of magnetic tape on the mask. Set switch S to position 1. Full deflection of the voltmeter now represents a light transmittance of 5 %.
Figure A.1 - Optical arrangement

Figure A.2 - Measuring circuitry
Annex B
(normative)

Measurement of Signal-to-Noise Ratio

The Signal-to-Noise Ratio shall be measured using a spectrum analyzer with a resolution bandwidth of 3 kHz. Unless otherwise stated, the test conditions are those defined in clause 10 of this ECMA Standard.

B.1 a.c. erase the tape to be tested.

B.2 Record the tape at 2 857,1 ftpmm. The associated recording frequency is denoted $f_1$.

B.3 Measure the rms signal amplitude by gating the sweep of the spectrum analyzer. Begin the measurements 1 ms after initial read head contact with the tape. Take the measurements for 1 ms. Each sweep yields one measured value. Compute the average of 8 measured values. This is $S_{tape}$.

Measure the total rms noise level at frequency $f_2$, where $f_2$ is 2 MHz smaller than $f_1$. Again take measurements for 1 ms as above. Each sweep yields one measured value. Compute the average of 100 measured values. This is $N_{total}$.

B.4 Measure the rms read channel noise level at frequency $f_2$ for 1 ms as in B.3, without a tape loaded but with the motors running. Each sweep yields one measured value. Compute the average of 8 measured values. This is $N_{amp}$.

B.5 Compute the Signal-to-Noise Ratio for this pass, $20 \log \frac{S_{tape}}{N_{tape}}$ dB,

where

$$N_{tape} = \sqrt{N_{total}^2 - N_{amp}^2}.$$ $$\frac{N_{amp}}{N_{tape}} \text{ shall be less than 0.7.}$$

B.6 Repeat B3 to B5 for at least 10 passes. Take the average of the 10 Signal-to-Noise Ratios to determine the Signal-to-Noise Ratio for the tape ($SNR_{tape}$).

B.7 Repeat B.1 to B.6 for the Secondary Standard Reference Tape, to give $SNR_{MSRT}$. The Signal-to-Noise Ratio characteristic is $SNR_{tape} - SNR_{MSRT}$ dB.
Annex C
(normative)

Method for determining the nominal and the maximum allowable recorded levels (pre-recording condition)

The following tests shall be carried out under the conditions defined in clause 10 of this ECMA Standard.

C.1 Method for determining the Nominal Recorded Level

C.1.1 Read the section of the Secondary Standard Amplitude Calibration Tape that has been recorded at 3 809,5 ftpmm. Note the read output and apply the appropriate calibration factor.

C.1.2 a.c. erase the Secondary Standard Reference Tape and record at 3 809,5 ftpmm, increasing the write current from a low value until the output on read equals, after applying the appropriate calibration factor, the value noted in C.1.1.

C.1.3 a.c. erase the interchange tape and record at 3 809,5 ftpmm with the current determined in C.1.2.

The read output from this tape is the Nominal Recorded Level for the physical recording density of 3 809,5 ftpmm.

C.1.4 Repeat C.1.1 to C.1.3 for the physical recording densities of 1 428,6 ftpmm, 1 904,8 ftpmm, 2 857,1 ftpmm and 3 809,5 ftpmm.

C.2 Method for determining the Maximum Allowable Recorded Level

C.2.1 a.c. erase the Secondary Standard Reference Tape and record at 3 809,5 ftpmm, increasing the write current until the output on read equals, after applying the appropriate calibration factor, 120 % of the value noted in C.1.1.

C.2.2 a.c. erase the interchange tape and record at 3 809,5 ftpmm with the current determined in C.2.1.

The read output from this tape is the Maximum Allowable Recorded Level for the physical recording density of 3 809,5 ftpmm.

C.2.3 Repeat C.2.1 and C.2.2 for the physical recording densities of 1 428,6 ftpmm, 1 904,8 ftpmm and 2 857,1 ftpmm.

C.3 Limits for the recorded levels

As a history of excessive recording levels can impair the operation of the recording system used in this ECMA Standard it is necessary to prescribe limits for the recording levels to which the tape has been subjected since the last bulk erasure and for the levels used when recording a tape for interchange. These levels are, for each of the physical recording densities of 1 428,6 ftpmm, 1 904,8 ftpmm, 2 857,1 ftpmm and 3 809,5 ftpmm, the Maximum Allowable Recorded Level for that physical recording density.

Note

It is recommended that a tape to be used for interchange should not have been previously recorded at levels higher than its Nominal Recorded Levels at the physical recording densities of 1 428,6 ftpmm, 1 904,8 ftpmm, 2 857,1 ftpmm and 3 809,5 ftpmm.
Annex D
(normative)

Representation of 8-bit bytes by 10-bit patterns

D.1 The 8-bit bytes are represented with the most significant bit to the left and the least significant bit to the right. The 10-bit patterns are represented with the bit recorded first to the left and the bit recorded last to the right.

D.2 The magnetic recording system chosen requires that the d.c. level of the recorded signals be maintained near zero.

All 10-bit patterns are either balanced to d.c. level of zero or have a d.c. imbalance of 6:4 or 4:6.

Each 10-bit pattern is accompanied by an indicator Q which instructs the translator which of the two alternative patterns should be selected for the next 10-bit pattern in order to maintain the lowest d.c. level.

Q' is the d.c. information of the previous pattern.
Q is the d.c. information of the current pattern.

D.3 The left-hand column indicates the hexadecimal notation of the 8-bit byte for ease of search.

</table>
Measurement of bit shift

The tape to be measured shall have been written by the tape drive used for data interchange.
The tape shall have been written in any mode compatible with system operation.

E.1 Reading equipment

The tape shall be read on any drive which supports a track straightness meeting the requirement of annex F.

There are no absolute requirements placed on the output voltage of the head. However, the head design, the rotary transformer, the pre-amplifier, the head-to-tape speed and the equalizer shall be chosen so as to avoid problems due to a low signal-to-noise ratio.

- Read head
  gap length 0,20 µm ± 0,05 µm
  angle of the head gap The gap in the head of positive azimuth shall make an angle of + 25° 0’ 0” ± 0° 15’ 0” with the axis of the scanner.
  The gap in the head of negative azimuth shall make an angle of - 25° 0’ 0” ± 0° 15’ 0” with the axis of the scanner.

- Head-tape contact and read channel
  The stability of the head-tape contact during the signal capture period (see E.2), together with the overall frequency response of the head, the rotary transformer, the pre-amplifier and the equalizer shall be sufficient to give a Signal-to-Noise ratio of better than 10 dB.

E.2 Measurement method

Bit shift shall be measured using computational signal processing of a digitized record of the playback voltage waveform at the equalizer output. The signal capture period shall start with the first bit of the Main Data Zone No. 1 (see 15.1) and finish when at least 25 000 Channel bits of the Main Data Zone have been read.

The signal processing algorithm shall perform the following steps

1) Input the digitized waveform from the Main Data Zone 1 into a timing extraction algorithm, e.g. a Fast Fourier Transform, which generates a series of fixed-interval time references for the nominal centres of the bit periods of the readback Channel bit signals from this zone. These references shall be sufficiently accurate that, when steps 2), 3) and 4) are executed, the bit error rate specified in 4) is achieved.

2) Extend this series of time references, at the same frequency and phase, into the remainder of the signal capture period. These references define the timing of the nominal centres of the bit periods of the readback Channel bit signals from the Main Data Zone 1.

3) Measure the playback voltage, to an accuracy of better than 2 %, at the nominal centre of each captured bit period from the Main Data Zone 1.

4) For each captured bit period from the Main Data Zone 1, deduce the state of the corresponding bit cell on the tape under test, by means of a detection method which has a bit error rate of less than 1 in 10 000. For each bit cell which is magnetized in the direction of head travel, assign to it a data value \( D \) of +1. For each bit cell which is magnetized in the direction opposite to head travel, assign to it a data value \( D \) of -1.
5) For each bit cell, form a vector of 4 elements. The elements shall be numbered 1, 2, 3 and 4. The value \( D_3 \) of the third element shall be the data value \( D \) of the current bit cell. The value \( D_4 \) of the fourth element shall be the data value \( D \) of the next bit cell. The values \( D_1 \) and \( D_2 \) respectively of the first and second elements shall be the data values \( D \) of the previous two bit cells. Thus, the vector has a vector value \( i \) which is one of a set of 16 possible vector values.

6) For each of the 16 vector values, compute the average \( V_i \) of the playback voltages, measured in step 3), of all bit cells whose vectors have that vector value \( i \).

7) Arrange the voltage averages and the data values to form 16 Volterra series, one per vector value. Each series shall be as defined below:

\[
V_i = A_{0000} + A_{0100} D_2 + A_{0010} D_3 + A_{1000} D_1 + A_{0001} D_4 + A_{1100} D_1 D_2 + A_{0110} D_2 D_3 + A_{0011} D_3 D_4 + A_{1010} D_1 D_3 + A_{1110} D_1 D_2 D_3 + A_{1011} D_1 D_2 D_4 + A_{1111} D_1 D_2 D_3 D_4
\]

(d.c. term)  
(signal terms)  
(linear ISI terms)  
(non-linear ISI terms)  
(more non-linear ISI terms)  
(more non-linear ISI terms)  
(non-linear ISI terms associated with bit shift)

8) Obtain the Volterra coefficients \( A_{0000} \) to \( A_{1111} \) by solving the 16 simultaneous equations formed in step 7).

9) The Volterra coefficients which indicate non-linear inter-symbol interference corresponding to bit shift are \( A_{1110} \) and \( A_{0111} \).

Note

The theoretical basis for this method is described in

Newby, P. and Wood, R., 1986
"The Effects of Nonlinear Distortion on Class IV Partial Response"
IEEE Transactions on Magnetics
Volume MAG-22, Number 5, September 1986, Page 1203

and an application of this method is described in

Williams, C.H., 1990
"The Measurement and Classification of Impairment for DVTR Transports"
8th Conference on Video, Audio and Data Recording
IEE Conference Publication No. 319, page 67
Annex F  
(normative)

Method of measuring the straightness of track edges

F.1 Condition  
The test piece shall be secured under a longitudinal tension between 0,04 N and 0,06 N.

F.2 Procedure  
Define a rectangular box of 59,148 mm x 7,5 µm with its longitudinal axis at an angle $\alpha = 4,895^\circ$ with the Tape Reference Edge and its centre on a line at a nominal distance of 4,454 5 mm from the Tape Reference Edge. Position this box over the leading edge of the track.

F.3 Requirement  
Place the box, by varying its position only along the longitudinal axis of the tape, in such a position that the track’s leading edge intersects its short sides only.

Figure F.1 - Track edge straightness
Annex G  
(normative)

ECC calculation

C1 shall be a GF(2^8) Reed-Solomon Code (64, 58, 7)  
C2 shall be a GF(2^8) Reed-Solomon Code (56, 48, 9)

* C1 parity completes as 2-block with interleave by symbol.  
The calculation on GF(2^8) is defined by the following polynomial:
\[ G(x) = x^8 + x^4 + x^3 + x^2 + 1 \]
\[ \alpha = (00000010) \]
The interleave depth of C1 is two bytes, that of C2 is eight blocks. The ECC bytes shall satisfy
\[ H_P \times V_P = 0 \]
\[ H_Q \times V_Q = 0 \]
The generator polynomials shall be
\[ G_P (x) = \prod_{i=0}^{5} (x - \alpha^i) \]
\[ G_Q (x) = \prod_{i=0}^{7} (x - \alpha^i) \]

V_Q = Q_{m, n} + Q_{m+8, n} + Q_{m+16, n} + Q_{m+24, n} + Q_{m+32, n} + Q_{m+40, n} + Q_{m+48, n} + Q_{m+56, n} + Q_{m+64, n} + Q_{m+72, n} + Q_{m+80, n} + Q_{m+88, n} + Q_{m+96, n} + Q_{m+104, n} + Q_{m+112, n} + Q_{m+120, n} + Q_{m+128, n} + Q_{m+136, n} + Q_{m+144, n} + Q_{m+152, n} + Q_{m+160, n} + Q_{m+168, n} + Q_{m+176, n} + Q_{m+184, n} + Q_{m+192, n} + Q_{m+200, n} + Q_{m+208, n} + Q_{m+216, n} + Q_{m+224, n} + Q_{m+232, n} + Q_{m+240, n} + Q_{m+248, n} + Q_{m+256, n} + Q_{m+264, n} + Q_{m+272, n} + Q_{m+280, n} + Q_{m+288, n} + Q_{m+296, n} + Q_{m+304, n} + Q_{m+312, n} + Q_{m+320, n} + Q_{m+328, n} + Q_{m+336, n} + Q_{m+344, n} + Q_{m+352, n} + Q_{m+360, n} + Q_{m+368, n} + Q_{m+376, n} + Q_{m+384, n} + Q_{m+392, n} + Q_{m+400, n} + Q_{m+408, n} + Q_{m+416, n} + Q_{m+424, n} + Q_{m+432, n} + Q_{m+440, n}
\]
where

\[ P_{ij} = C_1 \text{ bytes} \]

\[ Q_{ij} = C_2 \text{ bytes} \]

\( i = \text{Block Number} \)

\( j = \text{Serial Number} \)

For C1:

\( k = 0, 1, \ldots, 223 \)

\( l = 0, 1 \)

if \( k = 0 \) to 15, or 208 to 223 then \( D_{ij} \) in \( V_p \) is read as \( Q_{ij} \)

For C2:

\[ 0 \leq m \leq 7 \]

\[ 0 \leq n \leq 63 \]

Both sets of 64 bytes contained in each cell are identified by a Serial Number in the range 0 to 63 and constitute a Block identified by a Block Number.
Annex H
(informative)

Recommendations for transportation

H.1 Environment
It is recommended that during transportation the cartridges are kept within the following conditions:

- temperature: -40 °C to 45 °C
- relative humidity: 5% to 80%
- wet bulb temperature: 26 °C max.

There shall be no condensation in or on the cartridge.

H.2 Hazards
Transportation of recorded cartridges involves three basic potential hazards.

H.2.1 Impact loads and vibrations
The following recommendations should minimize damage during transportation.

a) Avoid mechanical loads that would distort the cartridge shape.

b) Avoid dropping the cartridge more than 1 m.

c) Cartridges should be fitted into a rigid box containing adequate shock-absorbent material.

d) The final box must have a clean interior and a construction that provides sealing to prevent the ingress of dirt and water.

e) The orientation of the cartridges within the final box should be such that the axes of the tape reels are horizontal.

f) The final box should be clearly marked to indicate its correct orientation.

H.2.2 Extremes of temperature and humidity

a) Extreme changes in temperature and humidity should be avoided whenever possible.

b) Whenever a cartridge is received it should be conditioned in the operating environment for a period of at least 24 h.

H.2.3 Effects of stray magnetic fields
A nominal spacing of not less than 80 mm should exist between the cartridge and the outer surface of the shipping container. This should minimize the risk of corruption.
Annex J
(informative)

Read-After-Write

Read-After-Write (RAW) is a technique by which a Frame is read immediately after being written, examined to determine if it was written successfully, and re-written if not. The unit of RAW is a Frame. The RAW technique is applicable only in the Data Area of a tape, and is not applied to Amble Frames. Where RAW is applicable, it may be applied or not applied to individual Frames, regardless of whether or not it is applied to other Frames. When a Frame is identified, during a Read-After-Write check, as having been unsuccessfully written, it is rewritten further along the tape, i.e. the original Frame is not overwritten by the re-written Frame.

The primary intent of the RAW check is the detection of Frames containing errors of significant size and/or quantity, e.g. as caused by non-trivial media defects. Consequently, where RAW is applied it is not necessary that all Channel bits be read correctly to avoid a re-write. Instead, the minimum requirement needs to be only that the quality of the recording and the quantity of correctly decoded data is such that the data of the entire Frame is recoverable with sufficient margin for reliable data interchange.

The actual performance of a Frame against this requirement can be assessed in a number of ways, for example by measuring the length, severity and/or distribution of missing pulses, counting the number of errors detected by C1 and/or C2, comparing written and read checksums, comparing written and read data on a sampled or full time basis.

Where a Frame has been rewritten multiple instances of it will exist. It is possible that a subsequent read will successfully recover data from more than one instance of a Frame. In such case, it is recommended that the last successfully recovered instance be used, since previous ones may have been considered unsuccessfully written.
Annex K
(informative)

Example of the content of a Basic Group No. 0

All entries in byte position 1 to 400 are followed by (00) and the remainder of the field is padded with (00).

<table>
<thead>
<tr>
<th>Byte Position</th>

Annex L  
(informative)

Examples of MIC chip

This annex describes two commercially available chips that can be used with the cartridge specified by this ECMA Standard, viz. Serial I²C EEPROM ST24E16 and ST25E16. Complete technical information on these chips – inclusive signals description, device and read/write operations – is publicly available from STMicroelectronics on the Internet sites:

http://www.st.com
http://www.st.com/stonline/books/index.htm

With the latter site, “ST24E16 SERIAL EXTENDED ADDRESSING COMPATIBLE WITH I²C 16K (2K x 8) EEPROM” can be found in the part list after choosing “Serial EEPROM I²C Bus category”.

Figure 1 of the description of these EEPROM describes the logical diagram. Figure L.1 below shows the allocation of signals to the Access Holes specified in 8.22.

![Figure L.1 – Correspondence between Access Holes and chip contacts](99-0039-A)

As shown in figure L.1, Access Hole ID is not used in this ECMA Standard.

The symbol "K" used in these sites is meant to indicate the decimal value 1 024. Thus, the MIC chips mentioned in this annex have a capacity of 2 048 bytes.
