

Array comprehensions

Dave Herman

July 29, 2010

Declarative syntactic sugar

```
[ key.toUpperCase() for (key in obj) ]
```

Declarative syntactic sugar, ctd.

```
let (result = []) {  
  for (let key in obj) {  
    result[result.length] = key.toUpperCase();  
  }  
  => result  
}
```

high-integrity array construction

high-integrity array push

Filtering

```
[ val for ([key, val] in properties(obj)) if (key % 2) ]
```

Filtering, ctd.

```
let (result = []) {  
  for (let [key, val] in properties(obj)) {  
    if (key % 2)  
      result[result.length] = val;  
  }  
  => result  
}
```

Comprehension clauses

CompClause ::= ForClause LetClause? IfClause?

ForClause ::= “**for**” (“ LHSExpression “**in**” Expression ”)”

LetClause ::= “**let**” LetHead

IfClause ::= “**if**” (“ Expression ”)”

Summary

- Simple syntactic sugar, big readability win.
- Fits into existing grammar pretty well!
- Plenty of prior art: Python, Haskell, math.
