## XmlWriter() Constructor

```
[ILAsm]  
family rtspecialname specialname instance void .ctor()  
  
[C#]  
protected XmlWriter()
```

### Summary

Constructs a new instance of the `System.Xml.XmlWriter` class.

# XmlWriter.Close() Method

```
[ILAsm]  
.method public hidebysig virtual abstract void Close()  
  
[C#]  
public abstract void Close()
```

## Summary

Closes the writer.

## Behaviors

This method closes any remaining open elements or attributes.

This method calls the `System.Xml.XmlWriter.Flush` method to flush the underlying buffered stream and then closes the stream.

This method sets the `System.Xml.XmlWriter.WriteState` to `System.Xml.WriteState.Closed`.

## How and When to Override

This method must be overridden in order to provide the functionality described above, as there is no default implementation.

# XmlWriter.Flush() Method

```
[ILAsm]  
.method public hidebysig virtual abstract void Flush()  
  
[C#]  
public abstract void Flush()
```

## Summary

Clears all buffers and causes any buffered data to be written to the underlying stream.

## Behaviors

As described above.

## How and When to Override

This method must be overridden in order to provide the functionality described above, as there is no default implementation.

# XmlWriter.LookupPrefix(System.String) Method

```
[ILAsm]  
.method public hidebysig virtual abstract string LookupPrefix(string  
ns)

## Parameters

Parameter	Description
<i>ns</i>	A <code>System.String</code> specifying the namespace URI.

## Return Value

# XmlWriter.WriteAttributes(System.Xml.XmlReader, System.Boolean) Method

```
[ILAsm]  
.method public hidebysig virtual void WriteAttributes(class  
System.Xml.XmlReader reader, bool defattr)  
  
[C#]  
public virtual void WriteAttributes(XmlReader reader, bool defattr)
```

## Summary

## Parameters

Parameter	Description
<i>reader</i>	A System.Xml.XmlReader from which to copy the attributes.
<i>defattr</i>	A System.Boolean where true specifies to copy the default attributes from <i>reader</i> ; otherwise, false.

## Behaviors

If the reader is positioned on an Element or XmlDeclaration node, this method writes all the contained attributes. If the reader is positioned on an Attribute node, this method writes the current attribute, then the rest of the attributes until the closing tag is reached. If the reader is positioned on any other node type, this method throws an exception.

## Default

This method positions the reader by calling its System.Xml.XmlReader.MoveToFirstAttribute and System.Xml.XmlReader.MoveToNextAttribute methods, and retrieves the value of the attributes by calling the System.Xml.XmlReader.ReadAttributeValue method of the reader.

## How and When to Override

Override this method to remove any content that would invalidate the document.

## Usage

Use this method to write all the attributes found at the current position.

## Exceptions

Exception	Condition

public abstract void WriteQualifiedName(string localName, string ns)
```

## Summary

Writes the qualified name.

## Parameters

Parameter	Description
<i>localName</i>	A System.String specifying the local name to write.
<i>ns</i>	A System.String specifying the namespace URI to associate with <i>localName</i> .

## Behaviors

This method writes the qualified name. If *ns* maps to the current default namespace, no prefix is generated. When writing attribute values, this method generates a prefix if *ns* is not found. When writing element content, it throws an exception if *ns* is not found.

## How and When to Override

This method must be overridden in order to provide the functionality described above, as there is no default implementation.

## Exceptions

Exception	Condition
<b>System.ArgumentException</b>	<i>localName</i> is null, is System.String.Empty,

	or is not a valid XML name.
<b>System.InvalidOperationException</b>	The System.Xml.XmlWriter.WriteState is System.Xml.WriteState.Closed.

## Exceptions

Exception	Condition
<code>System.ArgumentNullException</code>	<i>buffer</i> is null.
<code>System.ArgumentException</code>	The buffer length minus <i>index</i> is less

	than <i>count</i> .
<b>System.ArgumentOutOfRangeException</b>	<i>index</i> or <i>count</i> is less than zero.
<b>System.InvalidOperationException</b>	The System.Xml.XmlWriter.WriteState is System.Xml.WriteState.Closed.

## Parameters

Parameter	Description
<i>localName</i>	A System.String specifying the local name of the element.

# XmlWriter.WriteStartElement(System.String, System.String, System.String) Method

```
[ILAsm]  
.method public hidebysig virtual abstract void  
WriteStartElement(string prefix, string localName, string ns)  
  
[C#]  
public abstract void WriteStartElement(string prefix, string  
localName, string ns)
```

## Summary

Writes a start element with the specified name, and associates it with the given namespace and prefix.

## Parameters

Parameter	Description
<i>prefix</i>	A System.String specifying the namespace prefix of the element.
<i>localName</i>	A System.String specifying the local name of the element.
<i>ns</i>	A System.String specifying the namespace URI to associate with the element.

## Behaviors

This method writes a start element and name, and associates it with a namespace and prefix. If the namespace is already in scope and has an associated prefix, that prefix is automatically written also.

If any of the input parameters are null or System.String.Empty, the start element is written with that parameter missing.

## How and When to Override

When overriding this method, also override the System.Xml.XmlWriter.WriteEndElement, System.Xml.XmlWriter.WriteString, and System.Xml.XmlWriter.WriteRaw methods so they close any open start element.

## Usage

Use this method to write a specified start element and name, and associate it with a given namespace and prefix. Write any attributes using the `System.Xml.XmlWriter.WriteStartAttribute`, `System.Xml.XmlWriter.WriteString`, and `System.Xml.XmlWriter.WriteEndAttribute` methods, then close the element using the `System.Xml.XmlWriter.WriteEndElement` method.

## Exceptions

Exception	Condition
<b>System.InvalidOperationException</b>	The <code>System.Xml.XmlWriter.WriteState</code> is <code>System.Xml.WriteState.Closed</code> .

## Example

See `System.Xml.XmlTextWriter.WriteStartElement` for an example demonstrating this method.

# XmlWriter.WriteString(System.String) Method

```
[ILAsm]  
.method public hidebysig virtual abstract void WriteString(string  
text)  
  
[C#]  
public abstract void WriteString(string text)
```

## Summary

Writes the specified text.

## Parameters

Parameter	Description
<i>text</i>	A <code>System.String</code> specifying the text to write.

## Behaviors

This method performs the following conversions before writing the text:

- The characters '&', '<', and '>' are replaced with "&amp;", "&lt;", and "&gt;", respectively.
- Character values in the range 0x-0x1F (excluding the white space characters 0x9, 0x10, and 0x13) are replaced with numeric character entities ("&#0;" through "&#0x1F").
- If called in the context of an attribute value, double and single quotes are replaced with "&quot;" and "&apos;" respectively.

If *text* is null or `System.String.Empty`, this method writes a text node with no data content.

## How and When to Override

This method must be overridden in order to provide the functionality described above, as there is no default implementation.

## Exceptions

Exception	Condition
<b>System.InvalidOperationException</b>	The System.Xml.XmlWriter.WriteState is System.Xml.WriteState.Closed.

# XmlWriter.WriteSurrogateCharEntity(System.Char, System.Char) Method

```
[ILAsm]  
.method public hidebysig virtual abstract void  
WriteSurrogateCharEntity(valuetype System.Char lowChar, valuetype  
System.Char highChar)  
  
[C#]  
public abstract void WriteSurrogateCharEntity(char lowChar, char  
highChar)
```

## Summary

Generates and writes the surrogate character entity for the surrogate character pair.

## Parameters

Parameter	Description
<i>lowChar</i>	A System.Char containing the low surrogate. This must be a value between 0xDC00 and 0xDFFF.
<i>highChar</i>	A System.Char containing the high surrogate. This must be a value between 0xD800 and 0xDBFF.

## Description

[*Note:* Applications encode DOM strings using UTF-16. For both HTML and XML, the document character set (and therefore the notation of numeric character references) is based on UCS [ISO-10646]. A single numeric character reference in a source document might therefore in some cases correspond to two 16-bit units in a DOM string (a high surrogate and a low surrogate). These 16-bit units are referred to as a surrogate pair.

For more information regarding surrogates or characters, refer to section 3.7 of the Unicode 3.0/Unicode 2.0 standard located at <http://www.unicode.org>, or section 2.2 of the W3C XML 1.0 Recommendation located at <http://www.w3.org/TR/REC-xml#charsets>.

]

## Behaviors

This method generates and writes the surrogate character entity for a surrogate character pair. The surrogate character entity is written in hexadecimal format. The range for surrogate characters is #x10000 to #x10FFFF. The following

formula is used to generate the surrogate character entity: (*highChar* - 0xD800) \* 0x400 + (*lowChar* - 0xDC00) + 0x10000.

## How and When to Override

This method must be overridden in order to provide the functionality described above, as there is no default implementation.

## Exceptions

Exception	Condition
<b>System.ArgumentException</b>	An invalid surrogate character pair was passed.
<b>System.InvalidOperationException</b>	The <code>System.Xml.XmlWriter.WriteState</code> is <code>System.Xml.WriteState.Closed</code> .
