## Summary

Represents a nullable value type. An instance of `System.Nullable<T>` can contain a value of type `T` or an indication that the instance contains no value. Upon boxing, if it contains no value, it will be converted to the null reference; otherwise, it will be converted to a boxed `T`. [Note: Because of the constraint on the generic parameter, `T` cannot be of type `System.Nullable<U>` for any `U`. end note]

## Inherits From: System.ValueType

**Library:** BCL

**Thread Safety:** This type is not guaranteed to be safe for multithreaded operations.

## Description

The `System.Nullable<T>` value type represents a value of a given type `T` or an indication that the instance contains no value. Such a nullable type is useful in a variety of situations, such as in denoting nullable columns in a database table or optional attributes in an XML element. The runtime transforms `System.Nullable<T>` instances without values into true nulls when performing a box operation; instances with values are transformed into boxed `T`'s containing the `System.Nullable<T>`'s `Value`.

An instance of `System.Nullable<T>` has two properties, `System.Nullable<T>.HasValue` and `System.Nullable<T>.Value`. `System.Nullable<T>.HasValue` is used to determine whether the current instance currently has a value. It returns `true` or `false`, and never throws an exception. `System.Nullable<T>.Value` returns the current value of the instance, provided it has one (i.e., `System.Nullable<T>.HasValue` is `true`); otherwise, it throws an exception.

In addition to the above properties, there is a pair of methods, both overloads of `System.Nullable<T>.GetValueOrDefault`. The version taking no arguments returns the instance's current value, if it has one; otherwise, it returns the default value of type `T`. The version taking an argument of type `T` returns the instance's current value, if it has one; otherwise, it returns the default value argument passed to it.

Applying `System.Nullable<T>.HasValue` to an instance that has the default initial value, causes `false` to be returned.

# Nullable<T>(T) Constructor

```
[ILAsm]
public rtspecialname specialname instance void .ctor(!0 value)

[C#]
public Nullable(T value)
```

## Summary

Constructs and initializes a new instance of `System.Nullable<T>` giving it the specified initial value.

## Parameters

Parameter	Description
<i>value</i>	The initial value of the new instance.

## Description

[*Note:* Once this constructor has executed, applying `System.Nullable<T>.HasValue` to the new instance returns `true`.]

# Nullable<T>.Equals(System.Object) Method

```
[ILAsm]  
.method public hidebysig virtual bool Equals(object obj)  
  
[C#]  
public override bool Equals(object obj)
```

## Summary

Determines whether the current instance and the specified `System.Object` represent the same type and value.

## Parameters

Parameter	Description
<i>obj</i>	The <code>System.Object</code> to compare to the current instance.

## Return Value

The following table defines the conditions under which the return value is `true` or `false`:

Returned Value	HasValue Condition	<i>obj</i> .HasValue Condition
false	The current instance and <i>obj</i> have different types.	The current instance and <i>obj</i> have different types.
true	false	<i>obj</i> is null.
false	true	<i>obj</i> is null.
true	false	false
false	false	true
false	true	false
<code>Value.Equals(obj.Value)</code>	true	true

## Description

[*Note:* This method overrides `System.Object.Equals`.]

# Nullable<T>.FromNullable(System.Nullable<T>) Method

```
[ILAsm]  
.method public hidebysig static !0 FromNullable(valuetype  
System.Nullable`1<!0> value)  
  
[C#]  
public static T FromNullable(Nullable<T> value)
```

## Summary

Creates a T from a System.Nullable<T>.

## Parameters

Parameter	Description
<i>value</i>	The System.Nullable<T> value to convert to type T.

## Return Value

The value, if any, of the specified nullable value. Otherwise, a System.InvalidOperationException is thrown.

## Description

[*Note:* This method corresponds to the Op\_Explicit method.]

## Exceptions

Exception	Condition
<b>System.InvalidOperationException</b>	System.Nullable<T>.HasValue is false.

## Nullable<T>.GetHashCode() Method

```
[ILAsm]  
.method public hidebysig virtual int32 GetHashCode()  
  
[C#]  
public override int GetHashCode()
```

### Summary

Generates a hash code for the current instance.

### Return Value

If `System.Nullable<T>.HasValue` is true, a `System.Int32` containing the hash code for the value of the current instance is returned; otherwise, 0 is returned.

### Description

The algorithm used to generate the hash code is unspecified.

[*Note:* This method overrides `System.Object.GetHashCode()`.]

# Nullable<T>.GetValueOrDefault() Method

```
[ILAsm]  
.method public hidebysig !0 GetValueOrDefault()
```

```
[C#]  
public T GetValueOrDefault()
```

## Summary

Returns the value of the current instance, or if it has none, returns the default value for the type  $T$ .

## Return Value

A value of type  $T$ , which is either the value of the current instance, or if it has none, the default value for the type  $T$  (i.e., all-bits-zero).

## Description

[*Note:* `System.Nullable<T>.GetValueOrDefault(T)` allows a value other than the default value to be returned if the current instance contains no value.]

# Nullable<T>.GetValueOrDefault(T) Method

```
[ILAsm]  
.method public hidebysig !0 GetValueOrDefault(!0  
alternateDefaultValue)  
  
[C#]  
public T GetValueOrDefault(T alternateDefaultValue)
```

## Summary

Returns the value of the current instance, or if it has none, returns *alternateDefaultValue*.

## Parameters

Parameter	Description
<i>alternateDefaultValue</i>	The value to be returned if the current instance contains no value.

## Return Value

A value of type  $T$ , which is either the value of the current instance, or if it has none, the value of *alternateDefaultValue*.

## Description

[*Note:* `System.Nullable<T>.GetValueOrDefault()` allows the default value for type  $T$  to be returned if the current instance contains no value.]

# Nullable<T>.op\_Explicit(System.Nullable<T>) Method

```
[ILAsm]
.method public hidebysig static specialname !0 op_Explicit(valuetype
System.Nullable`1<!0> value)

[C#]
public static explicit operator T(Nullable<T> value)
```

## Summary

Perform an explicit conversion of a `System.Nullable<T>` value to type `T`.

## Parameters

Parameter	Description
<i>value</i>	The <code>System.Nullable&lt;T&gt;</code> value to convert to type <code>T</code> .

## Return Value

The value, if any, of the specified nullable value. Otherwise, a `System.InvalidOperationException` is thrown.

## Description

[*Note:* The conversion implemented by this method corresponds exactly to obtaining the value of the `System.Nullable<T>.Value` property.]

## Exceptions

Exception	Condition
<code>System.InvalidOperationException</code>	<code>System.Nullable&lt;T&gt;.HasValue</code> is false.

## Nullable<T>.op\_Implicit(T) Method

```
[ILAsm]  
.method public hidebysig static specialname valuetype Nullable`1<!0>  
op_Implicit(!0 value)
```

```
[C#]  
public static implicit operator Nullable<T>(T value)
```

### Summary

Perform an implicit conversion of a T value to System.Nullable<T>.

### Parameters

Parameter	Description
<i>value</i>	The T value to convert to System.Nullable<T>.

### Return Value

A System.Nullable<T> with the specified value.

### Description

[*Note:* The conversion implemented by this method corresponds exactly to invoking the System.Nullable<T>(T) constructor.]

# Nullable<T>.ToNullable(T) Method

```
[ILAsm]  
.method public hidebysig static valuetype Nullable`1<!0>  
ToNullable(!0 value)  
  
[C#]  
public static Nullable<T> ToNullable(T value)
```

## Summary

Creates a `System.Nullable<T>` from a `T`.

## Parameters

Parameter	Description
<i>value</i>	The <code>T</code> value to convert to <code>System.Nullable&lt;T&gt;</code> .

## Return Value

A `System.Nullable<T>` with the specified value.

## Description

[*Note:* This method corresponds to the `Op_Implicit` method.]

# Nullable<T>.ToString() Method

```
[ILAsm]  
.method public hidebysig virtual string ToString()  
  
[C#]  
public override string ToString()
```

## Summary

Returns a `System.String` representation of the value of the current instance.

## Return Value

If `System.Nullable<T>.HasValue` is true, `System.Nullable<T>.Value.ToString()` is returned; otherwise, `System.String.Empty` is returned.

## Description

[*Note:* This method overrides `System.Object.ToString`.]

# Nullable<T>.HasValue Property

```
[ILAsm]  
.property bool HasValue { public hidebysig virtual abstract  
specialname bool get_HasValue() }
```

```
[C#]  
public bool HasValue { get; }
```

## Summary

Indicates whether the current instance contains a value.

## Property Value

true if the current instance contains a value; otherwise false.

## Behaviors

If `System.Nullable<T>.HasValue` is true, the instance contains a value, and `System.Nullable<T>.Value` returns that value.

If `System.Nullable<T>.HasValue` is false, the instance contains no value, and an attempt to read `System.Nullable<T>.Value` results in a `System.InvalidOperationException` exception. A call to `System.Nullable<T>.Value.GetValueOrDefault` returns the default value.

This property is read-only.

# Nullable<T>.Value Property

```
[ILAsm]
.property !0 Value { public hidebysig virtual abstract specialname
!0 get_Value() }

[C#]
public T Value { get; }
```

## Summary

Gets the value, if any, of the current instance.

## Property Value

The value of the current instance.

## Behaviors

If `System.Nullable<T>.HasValue` is `true`, the instance contains a value, and `System.Nullable<T>.Value` returns that value.

If `System.Nullable<T>.HasValue` is `false`, the instance contains no value, and an attempt to read `System.Nullable<T>.Value` results in an exception.

This property is read-only.

## Exceptions

Exception	Condition
<code>System.InvalidOperationException</code>	<code>System.Nullable&lt;T&gt;.HasValue</code> is <code>false</code> .
